

**Bangladesh – India Friendship Power Company (Pvt.) Limited**  
(A Joint Venture of NTPC Ltd. and BPDB)

*Monitoring of Environment Parameter and Implementation of Environmental Management Plan during Construction Period along with Engineering Activities for 2X660 MW Maitree Super Thermal Power Project at Rampal in Bagerhat District*

## **31<sup>st</sup> Quarter Monitoring Report**

**Monitoring Period: November 2021 – January 2022**

May 2022

Monitoring of Environment Parameter and Implementation of Environmental Management  
Plan during Construction Period along with Engineering Activities  
for 2x660 MW Maitree Super Thermal Power Project at Rampal, Bagerhat

## **31<sup>st</sup> Quarterly Monitoring Report**

**Monitoring Period: November, 2021– January, 2022**

## Acknowledgements

The Center for Environmental and Geographic Information Services (CEGIS) is indebted to Bangladesh-India Friendship Power Company (Pvt.) Limited (BIFPCL) for awarding the contract on “Monitoring of Environment Parameter and Implementation of environmental Management Plan During Construction Period Along with Engineering Activities for 2x660 MW Maitree Super Thermal Power Project at Rampal, Bagerhat.” to CEGIS. The current document constitutes 31<sup>st</sup> quarterly monitoring aspects covering all the preselected parameters and locations as specified in EIA of Power plant as well as EIA of coal transportation.

CEGIS is Obligated to Mr. Anisur Rahman, Senior Secretary, Power, Energy and Mineral Resources for his dynamic leadership in this sector. CEGIS is also grateful to Mr. Gurdeep Singh, Chairman, BIFPCL for his vibrant role for wise guidance in completing the study. CEGIS expresses its gratitude to Engr. Md. Belayet Hossain, Chairman, Bangladesh Power Development Board (BPDB), for his continuous inspiration and support in all respect for conducting the study successfully. Moreover, CEGIS Team appreciates and acknowledges Engr. Kazi Absar Uddin Ahmed, Managing Director of BIFPCL for his kind considerations and anticipations. In addition, CEGIS is also thankful to Subhash Chandra Pandey, Project Director for his direction and guidance during the study. CEGIS also appreciates the support and guidance of Ravindra Kumar, Chief Technical Officer; and Kamendra Kumar Sharma, GM-EMG, BIFPCL throughout the study period.

Furthermore, CEGIS also appreciates Mr. Md. Arefin Badal, AD, DoE, Bagerhat and Mr. Md. Ekhlasur Rahman, Manager, M&E, BIFPCL for accompanying the team while carrying out monitoring activities at Sundarbans and its adjoining areas. In addition, CEGIS is also grateful to the field officials of different Government and Non-Government Organizations (NGOs) for contributing and sharing their ideas and views towards the project activities and associated existing problems of the study area along with their suggestions for sustainable continuation of the project activities and associated issues regarding power plant construction.

Last but not the least, the study team appreciates and acknowledges the concerns and perceptions of local people regarding the project and their active participations during field visits.

## Units

dB	Decibel
hr	Hour
Kg	Kilogram
Km	Kilometre
KV	Kilo Volt
KW	Killo Watt
m	Meter
mg	Milligram
MW	Mega Watt
Nm	Normal Meter
ppm	parts per million
ppt	parts per trillion
ton/year	Ton Per Year
s	Seconds

## Units Conversion Table

### General Units

1°C = 274.15 K=33.8° F  
1 hectare = 10<sup>-2</sup> km<sup>2</sup> = 2.471 acres  
1 kilogram = 2.20 pound  
1 kilometre = 0.62137 mile  
1 liter = 0.001 cubic meter  
1 meter = 3.2808 feet  
1 metric ton = 1000 kg  
1 mg/L ≈ 1 g/m<sup>3</sup> ≈ 1 ppm (w/w)  
1 mg/m<sup>3</sup> = 1 µg /L  
1 pascal = 1 N/m<sup>2</sup> = 0.01 millibar  
1 square mile = 640 acre = 2.590 km<sup>2</sup>

### Energy Units

1 GWyr = 8.76 x 10<sup>9</sup> kW  
1 horsepower = 746 W  
1 KWh = 3412 Btu  
1 kWh = 859.85 kcal  
1 KWh = 3.6 x 10<sup>6</sup> J  
1MW=1000KW=10<sup>6</sup>W

## Glossary

<i>Aman:</i>	Group of rice varieties grown in the monsoon season and harvested in the post-monsoon season. This is generally transplanted at the beginning of monsoon from July-August and harvested in November-Dec. Mostly rain-fed, supplemental irrigation needed in places during dry spell.
<i>Aus:</i>	Group of rice varieties sown in the pre-monsoon season and harvested in the monsoon season. These are broadcasted/transplanted during March-April and harvested during June-July. Generally, rain-fed, irrigation needed for HYVT. (High yield variety) Aus.
<i>B Aus:</i>	Broadcast Aus
<i>Bazar:</i>	Market
<i>Beel:</i>	A saucer-shaped natural depression, which generally retains water throughout the year and in some cases seasonally connected to the river system.
<i>Boro:</i>	A group of rice varieties sown and transplanted in winter and harvested at the end of the pre-monsoon season. These are mostly HYV and fully irrigated, planted in December-January and harvested before the onset of monsoon in April- May.
<i>Haat:</i>	Market place where market exchanges are carried out either once, twice or thrice a week, however not every day.
<i>Gear/Jaal:</i>	Different types of fishing net to catch fish from the water bodies.
<i>Kutchra:</i>	A house made of locally available materials with earthen floor, commonly used in the rural areas.
<i>Khal:</i>	A drainage channel usually small, sometimes man-made through which the water flows. These may or may not be perennial.
<i>Kharif:</i>	Pre-monsoon and monsoon growing season. Cropping season linked to monsoon between March-October, often divided into kharif-1 (March-June) and kharif-2 (July-October).
<i>Perennial Khal:</i>	Water available in the khal all the year round.
<i>Pacca:</i>	Well-constructed building using modern masonry materials.
<i>Rabi:</i>	Dry agricultural crop growing season; mainly used for the cool winter season between November and February.
<i>Seasonal Khal:</i>	Water not available in the khal all the year round.
<i>T. Aman:</i>	Transplanted Aman
<i>Upazila:</i>	Upazila is an administrative subdivision of a District.

## Executive Summary

This 31<sup>st</sup> quarterly monitoring report covers the status of EMP (Environmental Management Plan) implementation for the concurrent period (during construction stage) as recommended in the EIA (Environmental Impact Assessment) study of power plant vide Memo No: DoE/Clearance/5062/2011 dt. 05/08/2013 as well as EIA report of Coal Transportation vide Memo No: DoE/Clearance/5532/2016 dtd.31/01/2018. During the month of January, 2022 CEGIS team carried out the monitoring activities covering every monitoring aspects as assigned in the ToR (Terms of Reference) and approval conditions of DoE along with valuable suggestions and recommendations from different national and international organizations. In other words, the aspects can briefly be addressed as monitoring of the Environmental Compliances and monitoring of the selected environmental parameters such as ambient air quality, noise level, water quality, land resource, traffic management status, water resources management status, agricultural resources monitoring, fisheries resources, Socio-economic monitoring, aquatic & terrestrial ecosystem monitoring and the Sundarbans Reserve Forest (SRF) health monitoring.

However, the present environmental compliance monitoring includes the status of EMP implementation based on physical observation, investigation and interviews/discussion with the proponents and project officials, contractor or sub-contractors, or relevant authorities. A comprehensive due diligence checklist was prepared to monitor the environmental compliance of different components e.g., Environmental and Social Management System and Action Plan; Labour and Working Condition; Community Health, Safety and Security; Biodiversity and Sustainable Management of Living Natural Resources.

During the visit we found an immense workforce is working relentlessly to wrap-up the remaining works despite a recent spike in coronavirus cases. Currently mechanical and electrical works are underway while Major civil works like boiler, turbine, cooling tower, chimney, FGD, township has already been finished mostly. Major ongoing Civil, mechanical and electrical works in this quarter as observed are as follows:

- Mechanical and electrical works of Water Treatment Plant (WTP) is mostly done. RO plants (RO1 and RO2) are working continually for meeting up the construction and other required water.
- Civil works of ETP plant is ongoing where the effluent will be further treated before final discharge.
- Structural works of Flue Gas Desulphurization Plant (FGD) is almost done which will use wet limestone, forced oxidation process and using double flow contract scrubber would extract 96% of the Sulphur from the coal.
- Closed system Conveyor belt to transport Coal from jetty to the coal shed inside the plant premises is under installation.
- Coal yard/shed is under construction. Structural work has already done but the shed cover is yet to be installed.
- Construction of ash silo is in progress.

Due to the consecutive lockdown for spreading Corona Virus across at India and in Bangladesh the construction progress was temporarily decelerated that hindered to meet the anticipated commencement date for commercial operation but the plant authority and Bangladesh Government are very optimistic of launching the commercial operation on March 26, 2022. To make it happen EPC contractor i.e. Bharat Heavy Electricals Limited (BHEL) employed different local specialized sub-contractor i.e. KELLER, AFCON, POWER MAC etc. who are working tirelessly to meet the targeted date of commissioning of the plant.

In course of air quality monitoring it was observed that the concentration of major air pollutants was found comparatively lower in the Sundarbans area than that of the other monitoring locations. But due to the

seasonal effect the concentration of the particulate matter was found to be slightly higher at Khan Jahan Ali Bridge area though is comparable to the standards set by DOE. On the other hand, the concentration of SO<sub>2</sub>, NO<sub>x</sub>, CO and O<sub>3</sub> were found higher in the township area than the other locations but much lower than the standards set by ECR'97 (Amended). However, major sources of criteria pollutants generation in and around the project site as observed were the piling activities, digging, tunnelling and burrowing works, jetty erection activities, major construction works, dust from unpaved roads and vehicle movement, construction materials and goods transportation activities through the roads and river Passur etc. Other sources of pollutants which may contribute to the existing pollution load are the small industries like cement works and refinery industries etc., diffuse sources like wood stoves, fires and wind generated dust etc.

Observed noise level at *Chalna*, a commercial area located at a distance of 4 km to the north-west direction of the proposed chimney location was recorded as 59.71dB whereas its standard level is 70 dB of noise at *Kaigar Daskati* (48.82 dB) situated at the Gucchha Gram, a residential area located at north-west corner of the project area; *Chunkuri-2* (49.01 dB) located at 4km south-west direction from the chimney location; *Maidara Khal* (54.65 dB), south-west corner of the project area and a residential area and; *Shapmari* (50.03 dB) didn't cross their corresponding standard limits (55 dB) of noise level. The level of noise at *Barni (Gaurambha)* was found to be 48.89 dB which was 11.11 dB lower than that of standard limit (60 dB) of noise level for this location. The noise *Harbaria* (47.31 dB), *Akram Point* (37.41 dB) and *Hiron Point* (36.29 dB), the three ecologically silent zone were also not found to exceed the Bangladesh standard limit (50 dB) of their corresponding standard values (**Table: 2.4**). On the other hand, observed noise levels at Khan Jahan Ali Bridge (62.33 dB), a commercial zone, and Mongla Port (55.95 dB), an industrial zone, were also not found to exceed the Bangladesh standard limit of noise at their corresponding values (Table: 2.4). The standard noise limits for Khan Jahan Ali Bridge and Mongla Port during the day are 70 dB and 75 dB, respectively.

Passur River is highly influenced by tidal effects. Tidal penetration in the Passur River depends on seasonal change, upstream flow and catchment water discharge. However, the physico-chemical properties of Passur River changes with the tidal intrusion in different seasons.

During 31<sup>st</sup> quarterly monitoring, pH was found slightly basic in nature. Salinity, Temperature and Dissolved oxygen level was found in fair and favourable for the aquatic life forms. During the 30<sup>th</sup> quarter (post-monsoon, 2021), TDS and TH were found relatively same with respect to the same seasons of last consecutive years. Nitrate (NO<sub>3</sub><sup>-</sup>) level remained relatively lower. The phosphate (PO<sub>4</sub><sup>3-</sup>) was found within the safe limit of aquatic organisms. In case of metal pollution, no variation was recorded for As, Pb and Hg concentration and even no issues as well was observed. Oil & grease concentration was found less than 2.0 mg/L at all sites which is less than the recommended concentration (10 mg/L) for Inland Surface Water. However, the groundwater quality of the project adjacent area was also monitored and the concluding remark represent that the physical characteristics of groundwater quality is still in good condition with slight variation in pH and salinity which might be due to the surface water intrusion and infiltration because of excessive withdrawn of groundwater by the surrounding communities during the dry season. Project activities are not related to this sort of changes in salinity. Chemical characteristics of the groundwater quality are also found relatively good. The observed groundwater is completely free from the metal pollution particularly Lead and Mercury. But Arsenic pollution was recorded at Kapashdanga monitoring station during the last post monsoon. However, the other parameters were found to be well below the standard set by ECR'97.

In course of agricultural and land resources monitoring it was observed that, the salinity increased at all the monitoring plots which was the major observation for the soil quality monitoring. Organic matter concentration increased in three locations (Kapalimet, Bidiyarbon and Basherhula) and reduced in the rest. Among the base cation, monovalent cation (Sodium and Potassium) concentration mostly increased. Iron (Fe) concentration increased in all locations while Manganese (Mn) and Zinc (Zn) concentration reduced. Boron concentration also showed the similar pattern for organic matter. Pb and Cd concentrations were found to be higher than the last monitoring year, but still remained within the permissible limit.

Agricultural and livestock data were not collected during this monitoring field visit as per TOR obligation. Next survey will be conducted in the next pre-monsoon and report will be incorporated accordingly.

Fisheries resources monitoring during the 31st quarterly monitoring showed the changes in habitat uses in every past fiscal year along with the current one (as compared to the fiscal year of 2014-2015, 2015-2016, 2017-2018, 2018-2019, 2019-20 and 2020-21), caused mainly due to biophysical changes like tidal effect, forest erosion and vegetation coverage, seasonal variability, food availability and also fisheries management practices.

Moreover, through analyzing the type of habitat uses by different age group of fish species (based on the length-based community structure model) two types of habitats were found i.e. i) nursery ground and ii) maturation and feeding ground. Shannon-Weiner diversity index has also been observed to vary between 31st quarter with that of all previous quarters. Highest Shannon-Weiner index was found at Harbaria (0.71 out of 12 species) indicating moderate evenly distributed fish species. On the contrary, lowest evenness was found at the Mongla Point (0.06 out of 11 species). However, maximum FSR was obtained in the Charaputia Khal (n=33), while very low FSR was recorded at the Maidara and Mongla Point (n=11). Fries of fin fish and shrimp were widely distributed from middle stretches to the down stretches (Chandpai, Mongla and Maidara), juveniles age group in Akram Point, Haldikhali and Charaputia of the Passur River system. Adults of large-sized fishes were observed at the Akram Point, Haldikhali and Charaputia in this quarter monitoring. Fish species like Paissa, Datina and Poa attain the maximum abundance among the migratory fish species observed in the 31st quarter of monitoring. Moreover, among migratory species, Paissa and Poa were observed to migrate long distances. In this monitoring, the highest productivity was found in Charaputia and the lowest productivity at Maidara. The present study revealed that the highest catch susceptibility was also found in case of Charpata Jal (30 kg/haul).

In course of ecological monitoring vegetation composition, plant diversity, vegetation canopy status, plant health, bird habitat status, dolphin occurrence, benthos and plankton in aquatic ecosystems were monitored for this monitoring season. A total of 28 tree species were recorded from all the monitoring sites with Shanon-Winner diversity index of 1.89 which denotes the diversity is improved than previous monitoring tier. Canopy status revealed insignificant improvement comparing the same seasonal monitoring in last year. There is no change of plant health all the sites. None of the site recorded bird nest but migratory and local migratory avifauna were sighted at 7 wetlands out of 8; and which of two sites were the evidence of migratory birds with low populations. On the other hand, occurrences rate of dolphin in Passur-Maidara River revealed same and higher at Bhadra than previous monitoring all the surveyed river/khal reaches and this may be due to abundance of fishes and strictness of fishing activities within the restricted khals. A total of 33 phytoplankton and 15 zooplankton species has been recorded from the Passur and inland ponds.

Monitoring of Sundarban reserve Forrest health showed that Gewa (*Excoecaria agallocha*) and Sundari (*Heritiera fomes*) was the dominant species among all the PSPs followed by Passur (*Xylocarpus mekongensis*) and Kakra (*Bruguiera gymnorrhiza*). The forest floor was found moist with numerous crab holes and healthy vegetation in the Sutarkhali plot while in Karamjol, the forest floor was almost dry with a healthy green canopy. A lot of deer marks were found in Herbaria and Akram point and the dry forest floor in Akram point was covered with a substantial amount of crab molds but the number of top dying Sundari tree were higher and most of the tree were surrounded by parasites. Hiron point plot was fully sand carpeted where numerous dead Goran trees were observed. Species diversity indices showed that plots of Karamjol were more diversified compared to other Permanent sampling plots (PSPs). No significant variations in pneumatophores density, crab hole density, canopy cover changes, Leaf Area Index, and wood density were observed from the previous year's same season monitoring period. Among the sites, the comparison in tree diameter showed that the average tree diameter was higher in Karamjol whereas lower at Sutarkhali Point. Wood debris of tiny size classes were discovered more common in all sampling plots than in other classes where the Sutarkhali plot got the largest number of small wood debris followed by Hiron point, Akram point, Karamjal, and Herbaria. Medium, Large and sound wood were found highest in Hiron point. Higher wood debris indicates sound vegetation feed, nutrient cycling, and healthy habitat

for microorganisms. However, as Akram Point is situated at the confluence of Shibsa and Passur Rivers. Here, the forest is experiencing a retrogradation process where the climax species have started decaying, So the highest number of rotten woods were found here. No severe pest and disease attacks were observed in the monitoring PSPs except the top dying symptom of Sundari (*Heritiera fomes*). Phenological changes were not observed in all PSPs. Except for the top dying of Sundari (*Heritiera fomes*) tree species, forest health along the Passur River can be regarded to be steady (i.e. no adverse condition).

Moreover, the Socio-economic monitoring was conducted to explore project impacts on livelihoods, working environment, community health and safety, and activities under the Corporate Social Responsibility (CSR). For the study, physical observation, consultation and informal interviews collected information from the PMU and local communities. It is found that presently, about 10-15% of local labourers work at the project site. Now a days, the engagement of local labors is decreasing because of conducting more technical activities in the project site and relevant technicians are unavailable or rarely found in the study area. However, the scope of employment is increased in the study area because of fully operating wide and well-designed access road, bazaar at the zero point and other newly development initiatives (i.e. LPG industries, cement factories, solar power plant etc.) near to the project area. In addition, local people are trying to make some scope of developing small business opportunities which become possible especially due to the project intervention.

Most of the labor sheds were found clean with adequate toilet facilities, drinking water facilities, proper drain out and waste management facilities. However, floor of a labor shed was found about 1 feet low from the ground level where rain water regularly entered during monsoon, but no such issues were found for remaining other sheds. Adequate measures were taken to handle the Covid pandemic situation inside of the project area. A total of six (6) oxygen cylinders and necessary medicines were taken to stand by for taking care the emergency situation and covid patients. A hospital with modern equipment, ICU bed, physiotherapy unit and permanent doctor, were set up by the PMU. Here, project officials and affected/injured labors get the emergency support. This ensures safeguards for officials as well as the construction workers.

a number of mangroves, fruits, coconut, and herbal plants were planted in the project area and the program is still ongoing, though the survival rate of the plants (except mangrove trees) are not satisfactory. In this regard, a caretaker from the Forest Department is engaged for supervising the maintenance of the plants. At present mangrove plants are found in the project area which changes canopy coverage in the project area and creates living environments of life.

Under the CSR numerous medical campaigns along with different socially demand-based programs are being continued. BIFPCL allocated vaccination program under the CSR in which officials and labor force got vaccinated. Also, constructed water treatment and filtering RO systems at 4 locations in Rajnagar and Gaurambha Unions for ensuring safe water for the community under the CSR activity. Previously, sewing and ICT training were introduced for the livelihood development of the local community in the study area.

# 1. Introduction

## 1.1 Background

The scope of works as assigned has provisioned to monitor the environmental components, social indicators and the implementation status of EMP (Environmental Management Plan) during the construction phase of 2x660 MW Maitree Super Thermal Power Plant. As an independent environmental monitoring agency, CEGIS was engaged for conducting the said activities in accordance with the Power Plant EIA approval condition no. 32 and Coal Transportation EIA approval condition no.17.

The location of 2x660 MW MSTPP project encompasses Sapmari, Katakhal and Kaigar Daskati Mauza of Rajnagar Union under Rampal Upazila of Bagerhat District (**Figure 1.1**). The Power Plant lies in between latitude 22° 37' 0" N and 22° 34' 30" N and longitude 89° 32' 0" E and 89° 34' 5" E. The Plant site is located at about 23 km south from the Khulna City and near about 14 km from the north-west direction of nearest tip of the Sundarbans (considering the proposed chimney location). Location of the study area along with the distance from World heritage sites are presented in **Figure 1.1**.

The study area includes: i) Area covering 10 km radius from the Plant location, ii) Area within 5 km strip from both banks of the Passur river starting from the Plant site to Hiron point (**Figure 1.2**). As per the contract, the findings of the previously formulated quarterly monitoring reports have been submitted to BIFPCL.

Monitoring of Environmental parameters and associated data collection is being continued considering the spatial as well seasonal variations. However, in January, 2022 CEGIS team has carried out the 31<sup>st</sup> quarterly monitoring activities covering all the preselected monitoring parameters.

## 1.2 Objectives

The prime objectives of the study are:

- To monitor the important environment and social parameters during construction phase of the Power Plant and
- To monitor, the environmental compliances regarding EMP implementation during Power Plant's construction works and associated activities.

## 1.3 Criteria for Selection of Monitoring Sites/Locations

The monitoring sites have been selected considering the sensitivity and the ambience of the surroundings likely to be impacted from the Project related activities which includes-

- Wind speed and direction, sensitive receptors in and around the vicinity of the project site were considered for monitoring the ambient air quality. Potential areas were also identified and selected for noise level monitoring likely to be impacted by the project activities. Similarly, sites for water quality monitoring were selected considering the water resources (Maidara and other nearer water bodies, Passur River from Chalna to Hiron Point) likely to be impacted by the project activities.
- Potential locations for fisheries resources monitoring were selected considering the fish habitats, biodiversity, migration and production zones likely to be impacted by the project activities.
- Monitoring locations for ecosystem and biodiversity, Soil and land resources were selected considering the induced impacts of the Project related activities on the project surrounding areas.

- Monitoring of socio-economic conditions of the PAPs (Project Affected Peoples) and project surrounding communities were being carried out on the basis of their circumstances likely to be transformed and /or altered by the project activities.
- Locations for Sundarbans Reserve Forest (SRF) Health Monitoring were selected considering the potential access routes of coal transportation through Sundarbans Forest area and associated activities for different phases of the power plant development and operation which might have significant effects on Sundarbans's flora and fauna.
- Monitoring aspects for Environmental compliances regarding EMP implementation status in and around the project area has been set as per suggestions made in the EIA reports and approval conditions from DoE of both the Power Plant and Coal transportation studies respectively for ensuring environmental sustainability and social acceptability.

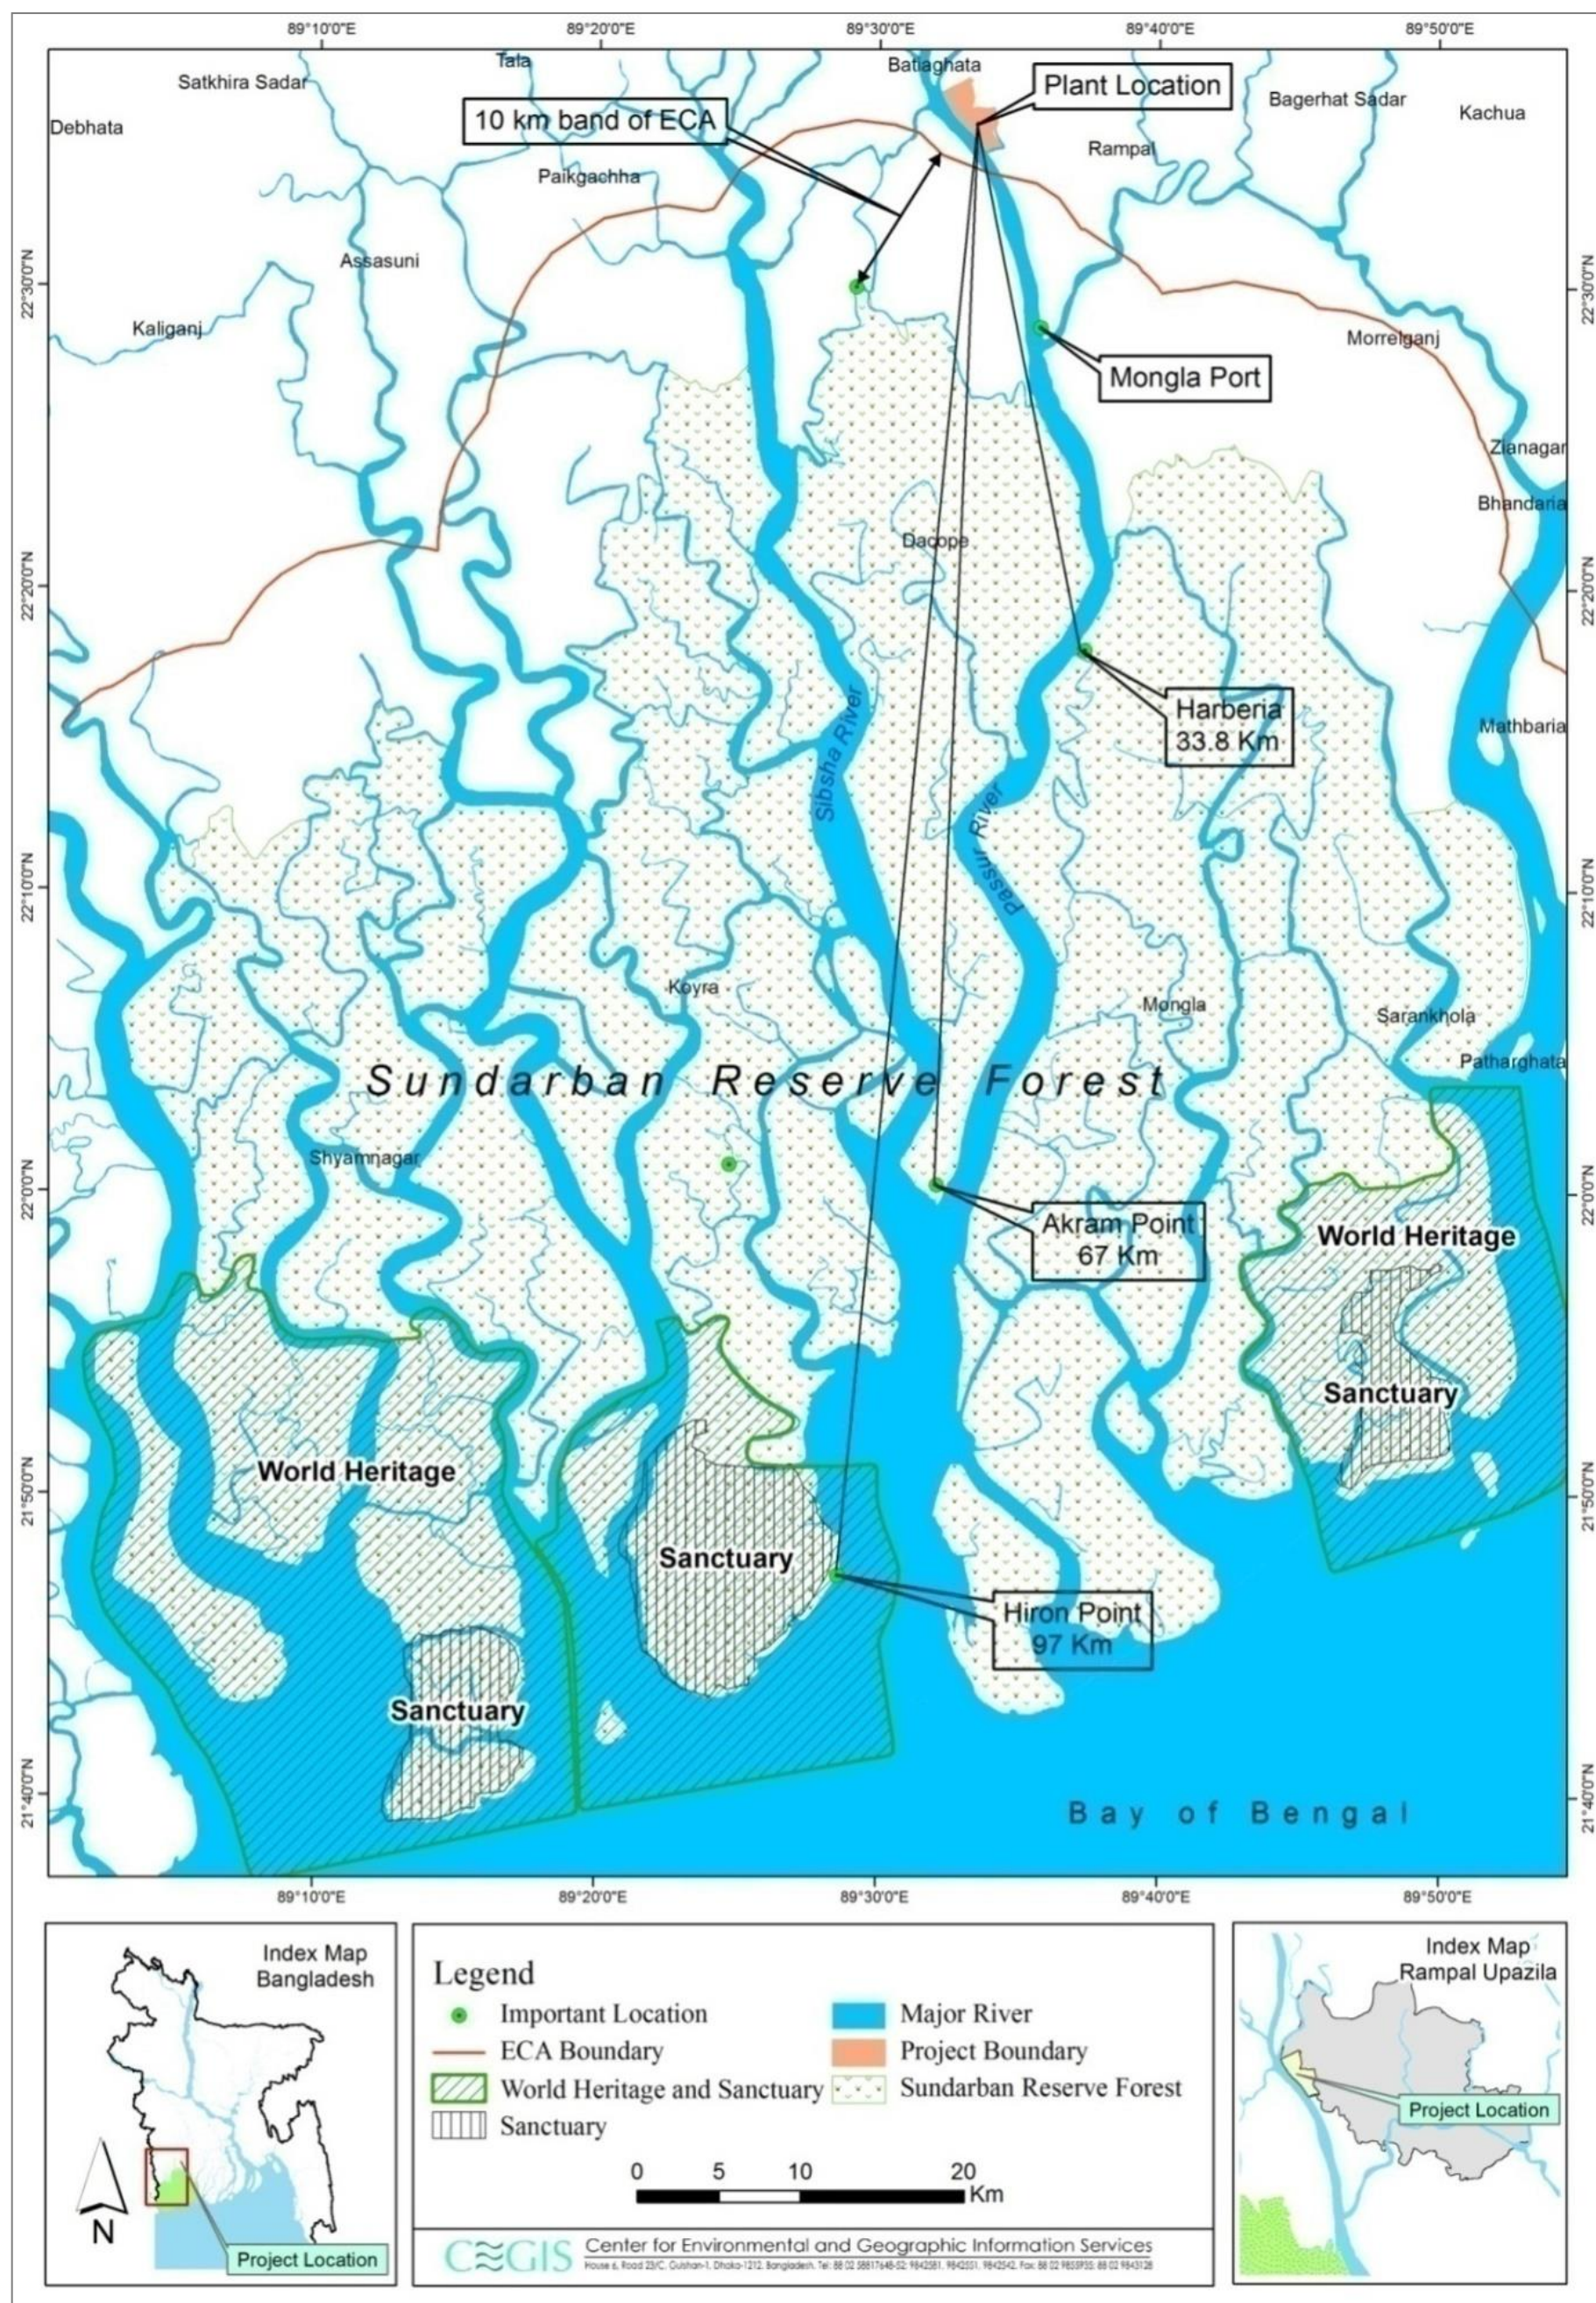

Figure 1.1: Location Map of the Study Area

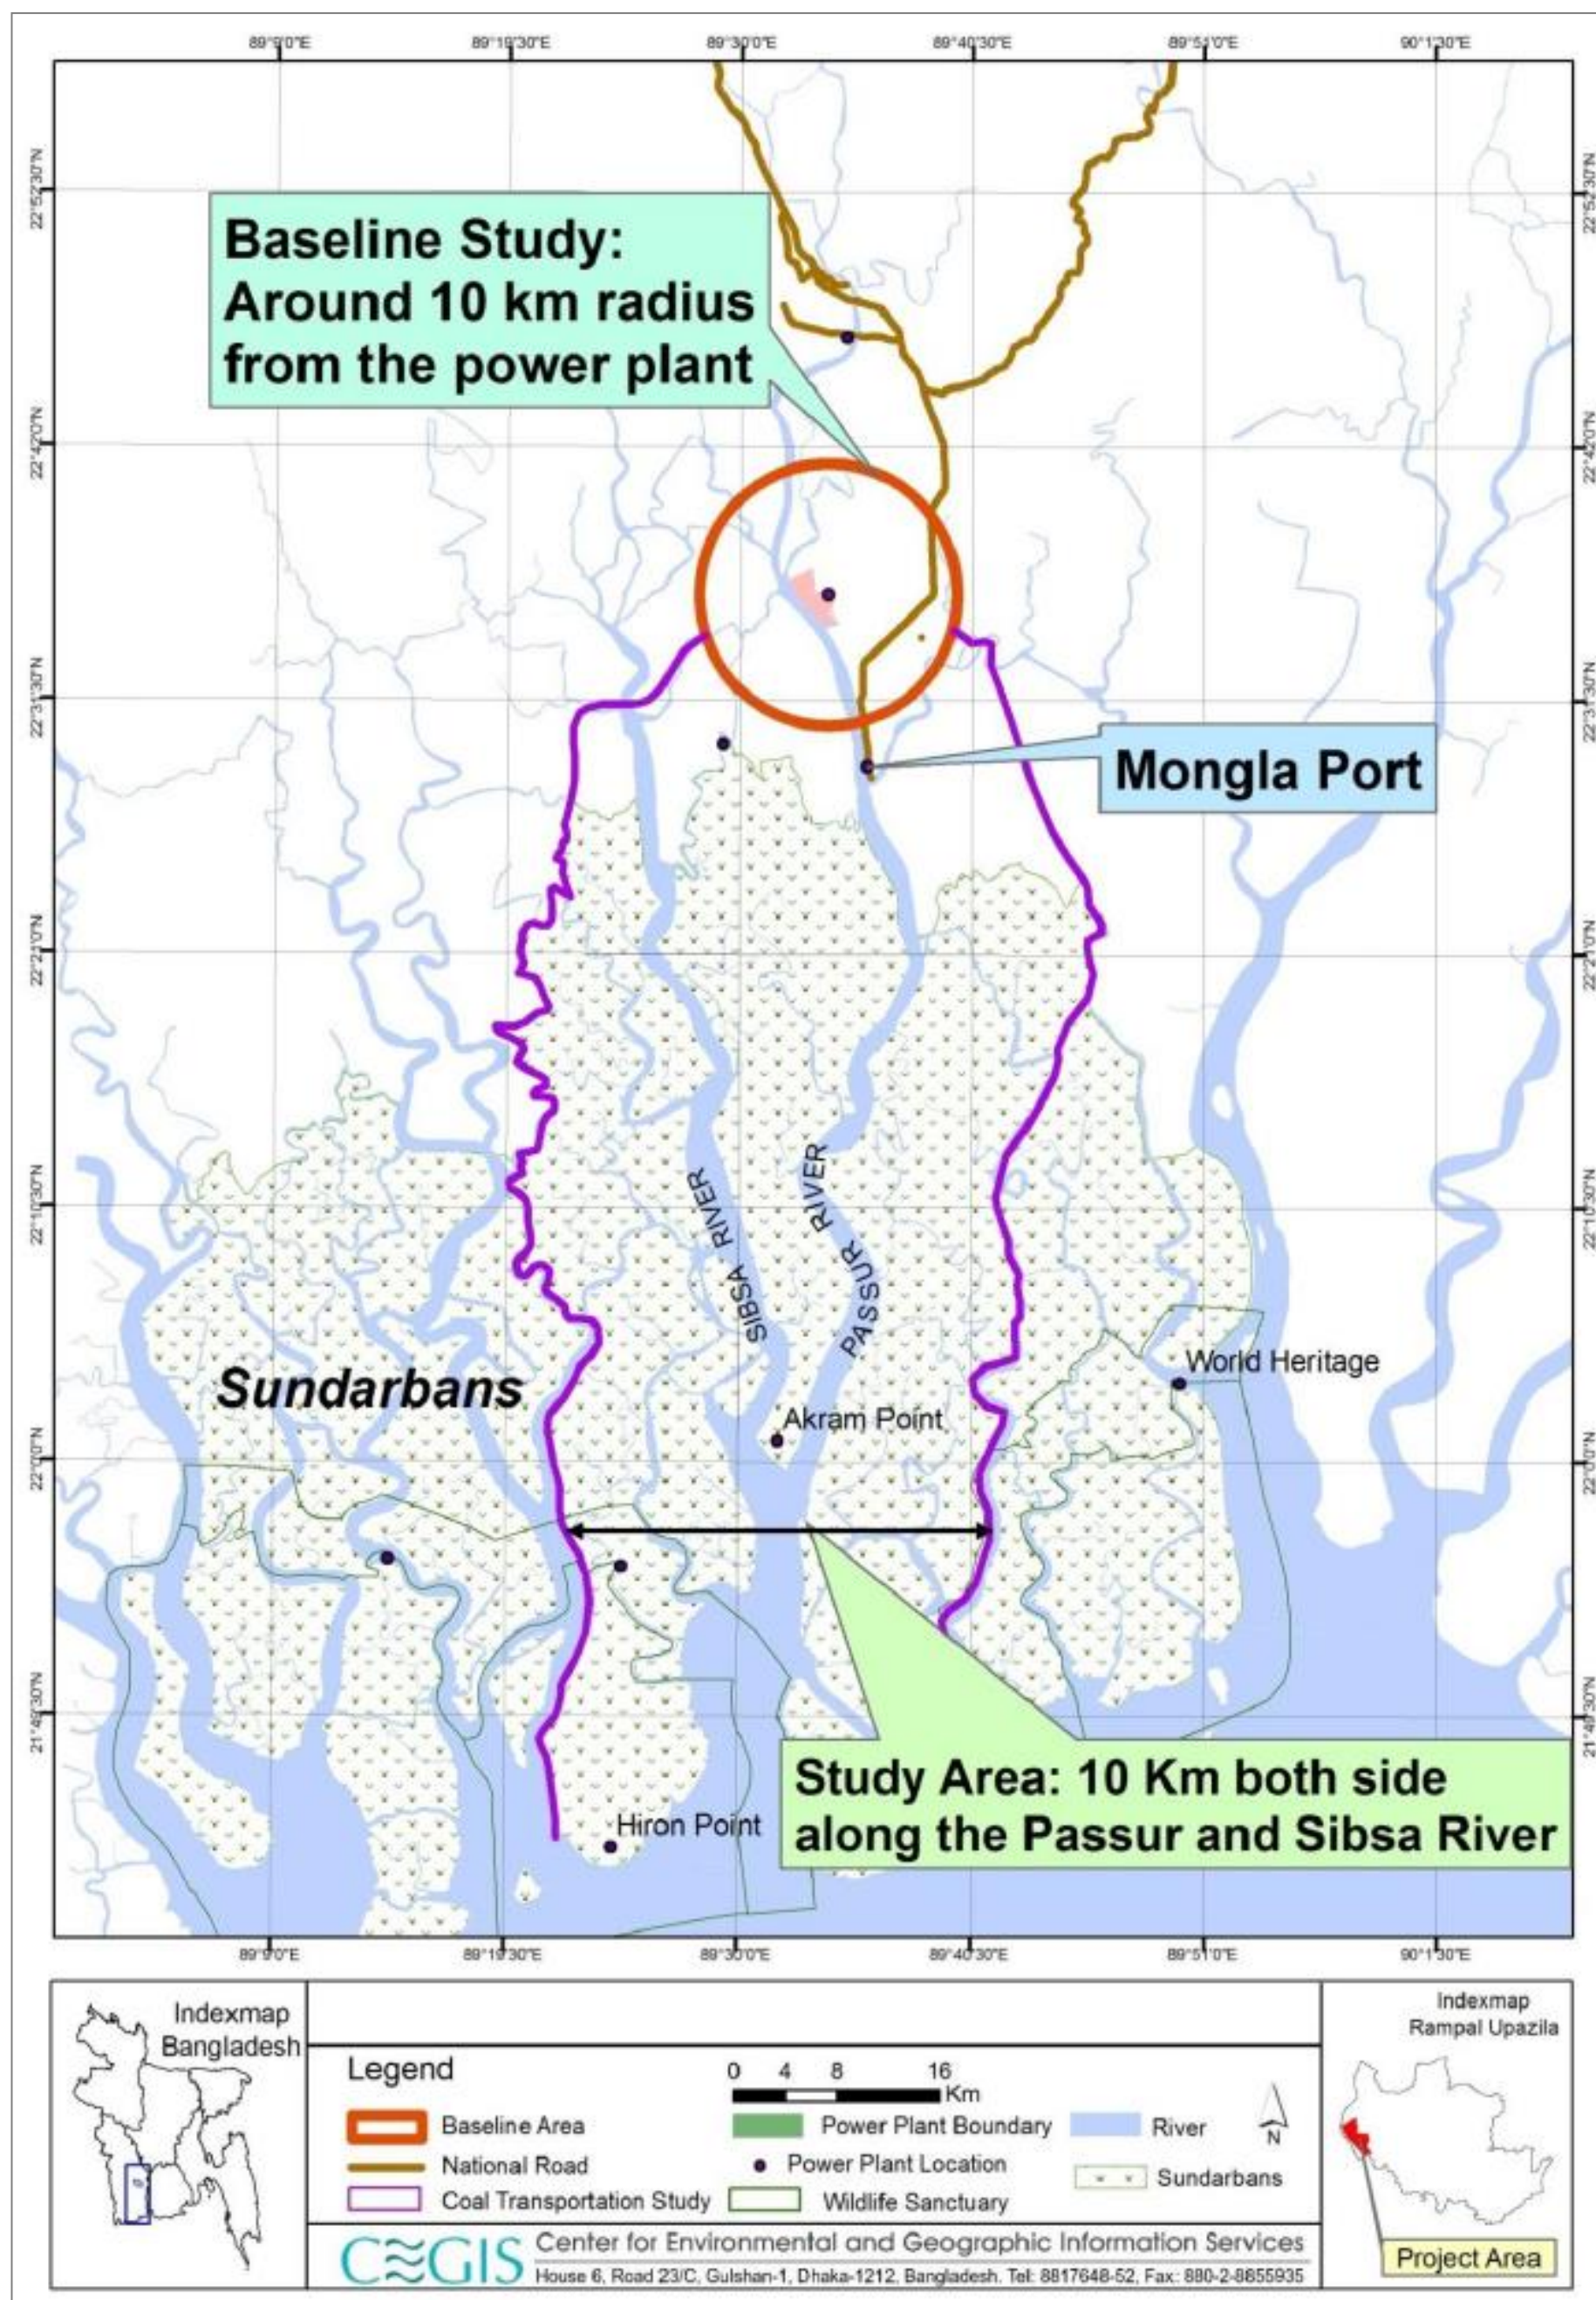

Figure 1.2: AOI of Environmental and Socio-economic Monitoring

## **1.4 Main Stakeholders**

### **1.4.1 Forest Department**

Monitoring of the Sundarbans Reserve Forest area need to be addressed as the conditions set out by the DoE. Hence, permission from the Forest Department is essential to carry out the said activities. The Forest Department has been providing the permission under certain conditions i.e. keeping close communication with the Forest Department, submission of the monitoring reports to the Forest Department along with the following activities:

- Inclusion of a Soil Scientist and a Botanist in the monitoring team,
- Monitoring of regeneration, in growths (seedlings), diseases and pests (if necessary, to carry out laboratory analysis),
- Monitoring of soil nutrients (macro, micro) and heavy metals,
- Monitoring of floral diversity, species richness and dominance,
- Measurement of carbon content both above and below the ground level,
- Assessment of impact on canopy cover, leaves phenology, flowers behaviour, pneumatophore and crab hole conditions.

However, BIFPCL forwards each copy of the earlier quarterly monitoring reports to the Chief Conservator of Forest, Bangladesh Forest Department, Agargaon, Dhaka and Conservator of Forest, Khulna Circle, Boyra, Khulna. Similarly, the report of 31<sup>st</sup> quarterly monitoring will also be forwarded to the same officials of the corresponding Departments.

### **1.4.2 Department of Environment (DoE)**

The monitoring plans, indicators, parameters, location have been selected and arranged by incorporating the suggestion(s) and approval condition(s) from both the Power Plant EIA study and Coal Transportation EIA study. The BIFPCL forwards the monitoring reports and data to DoE on a regular basis (Monthly and Quarterly). The monitoring reports are also presented to the Environmental Clearance Committee of the DoE during renewal of the site clearance. In addition, one representative from the local DoE office is involved in each monitoring visit to accompany the monitoring team.

### **1.4.3 Bangladesh India Friendship Power Company (Pvt.) Limited (BIFPCL)**

Bangladesh India Friendship Power Company (Pvt.) Limited (BIFPCL) is the Project Proponent of the proposed Power Project. The official(s) of BIFPCL has been assisting the study team from the beginning of the study. In addition, BIFPCL is thus far implementing the Environmental Management Plan (EMP) for ensuring environmental and social safeguarding of the Project surroundings including the Sundarbans Reserve Forest.

### **1.4.4 Local Community**

The Project Affected Peoples (PAPs) has been included in each of the social environment-monitoring program. The changes in important socio-economic indicators were examined through Focus Group Discussions (FGDs), Key informant interview(s) and other informal discussions with the local people in different locations of the project influenced area.

### **1.4.5 Major Component of Monitoring Study**

The Physical, Biological and Social aspects are monitored on regular basis and this quarterly monitoring report is furnished with the following subsequent chapters-

- Physical Environment covers monitoring of air quality, noise level, water quality, Soil and land resources, traffic management and the morphological study;
- Biological environment covers monitoring of fisheries resources, ecological resources and the Sundarbans Reserve Forest (SRF) health conditions;
- Socio-economic environment covers compensation, resettlement/rehabilitation, project related employment generation, labour and working condition, community health, security and safety, along with corporate social responsibilities.
- Environmental compliances monitoring includes Monitoring of Environmental and Social Management System Action Plan Implementation; Labour and working conditions; Community health, safety & security and Monitoring of biodiversity and sustainable management of living natural resources in and around the project area.

## 2. Physical Environment

### 2.1 Air Quality

Air is considered as one of the major environmental components and in this connection the parameters and monitoring locations of air quality were selected considering the major effects to be exerted by the power project activities during pre-construction, construction and operation stages. However, during the recent visit, all the preselected parameters and locations were monitored to observe major changes in air quality due to concurrent construction and supporting erection activities of the project.

#### 2.1.1 Methodology

In general, Particulate Matters (i.e., PM<sub>2.5</sub>, PM<sub>10</sub>, and SPM), SO<sub>x</sub>, NO<sub>x</sub>, CO and O<sub>3</sub> are expected to be generated from the Power Plant activities at its different phases i.e. pre-construction, construction and operation. However, the monitoring locations as well as the indicators for this study were selected during the EIA study based on a number of criteria e.g., the sensitivity of the receptors, project activities like movement of coal-carrying vessels, coal trans-shipment point; wind speed, wind direction, atmospheric deposition (Wet and Dry) and atmospheric stability classes etc. A comprehensive discussion on the recently assessed air quality is reported in the following sections.

#### 2.1.2 Method of Sampling and Laboratory Testing

Respirable Dust Sampler (Model-Envirotech India APM-460 BL) and Fine Particulate Sampler (Model-Envirotech India APM-550) were used to collect air samples from the selected sites. The PM<sub>2.5</sub>, PM<sub>10</sub>, and SPM were tested by gravimetric method. The concentration was analyzed by West-Gaeke method. Likewise, the concentration of NO<sub>2</sub> was tested by Jacob and Hochheiser method and concentration of Carbon Monoxide (CO) and Ozone (O<sub>3</sub>) were measured by Metravi CO-10 meter and Tongdy O<sub>3</sub> Monitor respectively.

#### 2.1.3 Pollution Sources in the Sundarbans

The key sources of air pollution around Mongla Port area and project site can be considered as cement factories, non-regulated mechanized boats, cargo vessels and ships and other commercial activities. The non-regulated ships, mechanized boats, cargo vessels plying through the Sundarbans Reserve Forest (SRF) in connection with the Mongla Port operation; fishing activities; honey, Golpata and timber collection; tourism etc. could be big contributing sources of air pollutants i.e., Particulate matters (PM<sub>2.5</sub>, PM<sub>10</sub> and SPM), Oxides of Sulphur (SO<sub>x</sub>), Oxides of Nitrogen (NO<sub>x</sub>) and Green House Gases (GHGs) in the study area as well as across the Passur channel. However, an inventory of the existing emission types and sources for the study area has been provided in **Table A2 of Appendix IV**.

#### 2.1.4 Monitoring Locations

Air quality is generally monitored at the fixed locations for each of the monitoring quarters. As per recommendations of DoE and experts' panel, two additional locations were included along with the existing monitoring locations. The air quality monitoring activities are shown in **Figure 2.1** and monitoring locations are shown in **Figure 2.2**. Details of the monitoring plan are attributed in **Table 2.1**.

Figure 2.1: Acquisition of Air Quality Monitoring data

Table 2.1: Air Quality Monitoring Plan

Sl. No.	Monitoring Indicators	Locations	GPS Points	Frequency	Methods/ Tools/ Techniques
1	Particulate Matter (PM <sub>2.5</sub> , PM <sub>10</sub> and SPM) SO <sub>x</sub> , NO <sub>x</sub> , CO and O <sub>3</sub> .	South West corner of the Project boundary	89°33'34.5"E; 22°34'33.8"N	Each Quarter of the year	Method of testing PM <sub>2.5</sub> : Gravimetric
2		Proposed township area near Chimney location, Mauza: Sapmari Katakhal.	89°32'3.8"E; 22°36'32.5"N		Method of testing PM <sub>10</sub> : USEPA (1997) Method 201 or 201A (as appropriate)
3		North West corner of the Project boundary (Kaigar Daskati)	89°33'51.8"E; 22°36'1.06"N		Method of testing SO <sub>x</sub> : USEPA (2000) Method 6 or 6A or 6B or ISO (1998)
4		Barni, Gaurambha Union (4km North East from the chimney location)	89°34'37.7"E; 22°38'51.8"N		Method 11632 (as appropriate)
5		Chunkuri-2, Bajua Union (4km South West from the chimney location)	89°34'01.1"E; 22°32'3.3"N		Method of testing NO <sub>x</sub> : USEPA (2000) Method 7, 7A, 7B, 7C, 7D, or ISO (1993) Method 10396 (as appropriate).
6		Pankhali, Dacope, (4km North West from the Chimney location)	89°31'24.2"E; 22°36'6.7"N		
7		Mongla Port Area	89°35'50.4"E; 22°28'24.8"N		
8		Harbaria, Sundarbans	89°35'34.2"E 22°17'43.1"N		
9		Akram point, Sundarbans	89°30'54.1"E 22° 23.50"N		
10		Hiron Point, Sundarbans	89°27'53.2"E; 21°46'27.60"N		
11		Khulna city near Khan Jahan Ali Bridge	89°35'35.5"E; 22°46'36.8"N		
12		Project site-1 (Proposed Township area)	89° 33' 13.7"E 22°35'43"N		
13		Access road bridge area	89°35'16.49" 22°34'37.11"N		

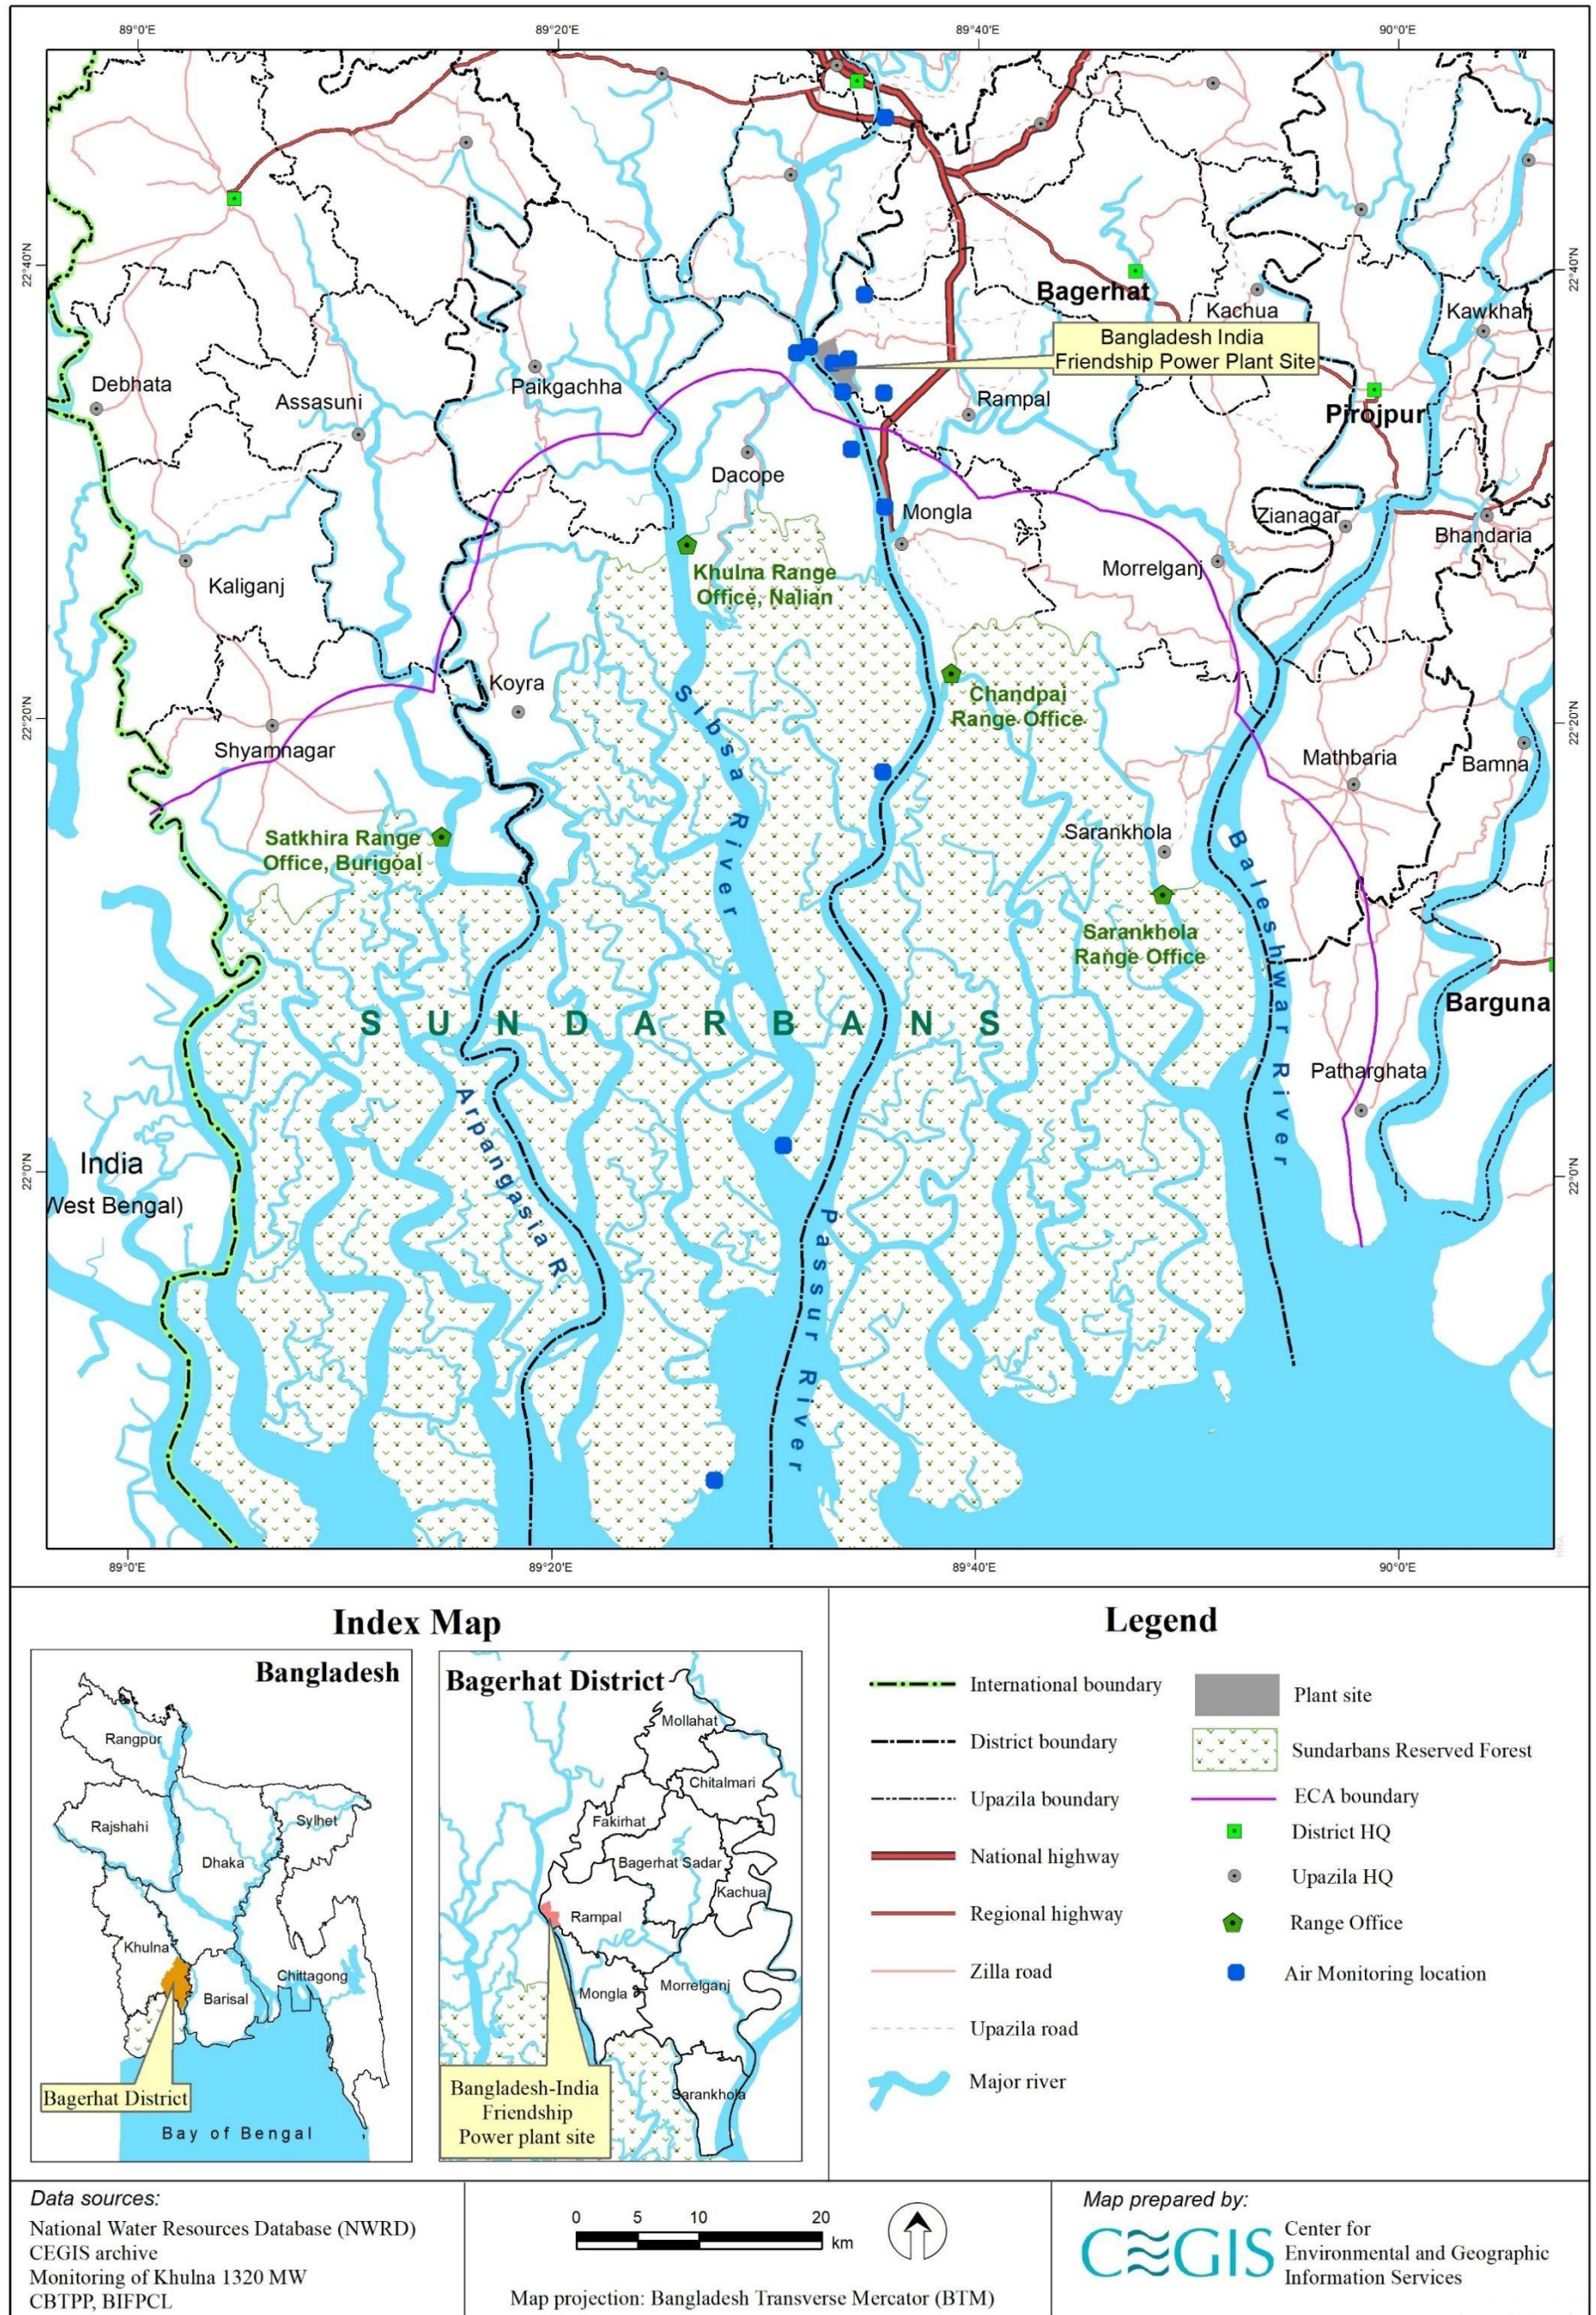

Figure 2.2: Air Quality Monitoring Locations

### 2.1.5 Status of Air Quality

The concentrations of the criteria pollutants along with the air pollution emission standards set by DoE are listed in **Table 2.2**. During this monitoring tier, the maximum value ( $61.57 \mu\text{g}/\text{m}^3$ ) of  $\text{PM}_{2.5}$  was found at Khan Jahan Ali Toll Plaza area whereas the minimum value ( $26.39 \mu\text{g}/\text{m}^3$ ) was recorded at Mongla Ghat area. On the other hand,  $\text{PM}_{10}$  concentration was found highest ( $104.73 \mu\text{g}/\text{m}^3$ ) at Township area of Power plant and lowest ( $43.88 \mu\text{g}/\text{m}^3$ ) at Gaurambha area. However, the concentration of SPM was also found highest ( $198.24 \mu\text{g}/\text{m}^3$ ) at Khan Jahan Ali Bridge Toll Plaza area in Khulna and the minimum concentration ( $77.88 \mu\text{g}/\text{m}^3$ ) was observed at Gaurambha area.

On the contrary, the concentration of Sulphur dioxide ( $\text{SO}_2$ ) in ambient air was found much lower than the Bangladesh standard limit of ( $365 \mu\text{g}/\text{m}^3$ ) at all the sampling locations. Among those, the maximum concentration ( $38.36 \mu\text{g}/\text{m}^3$ ) was found at Township area while the minimum concentration ( $11.79 \mu\text{g}/\text{m}^3$ ) was recorded at Koigardashkatir Char area. Similarly, the values of  $\text{NO}_x$  were also observed well below than the Bangladesh standard value of  $100 \mu\text{g}/\text{m}^3$ . During this monitoring period maximum concentration ( $44.77 \mu\text{g}/\text{m}^3$ ) of  $\text{NO}_x$  was found at Township area of Power plant area whereas the lowest concentration ( $16.73 \mu\text{g}/\text{m}^3$ ) was recorded at Bajua area of Dacope. The contributor of such  $\text{NO}_x$  emission may be from local human hauler, car, bus etc. and  $\text{SO}_2$  emission from industrial activities like brickworks, cement works, etc. Furthermore, during the monitoring period in January, 2022 it was observed that the maximum values of CO ( $3.3 \mu\text{g}/\text{m}^3$ ) and  $\text{O}_3$  ( $93 \mu\text{g}/\text{m}^3$ ) were measured at Township area though the results were found much lower than the standard value ( $10,000 \mu\text{g}/\text{m}^3$  and  $157 \mu\text{g}/\text{m}^3$ ) set in ECR' 2005 respectively. From the measured values, it can be concluded that effect of seasonal variations on the surrounding environment may be the prominent reason for increasing or decreasing of the concentrations of the criteria pollutants for the corresponding air sheds.

Though all the monitoring results at all locations were found well below the standard limit but to minimize the particulate matter as well as the other criteria pollutant's concentration inside the power plant, the authority may take the necessary initiatives as suggested in the EMP of the EIA study e.g. continuous or periodic water spraying on the connected road networks inside the power plant area, install water sprinkler system at the prominent infrastructures like office areas, township area etc. and the major construction area, strictly maintain the vehicular speed at the sensitive areas and properly maintain the EMPs as stated in the EIA study of the power plant.

The monitoring results are attached in **Table A1** of **Appendix IV**. The baseline emissions scenarios are appended in **Table A2** of **Appendix IV**.

#### *Seasonal variations among the air quality parameters*

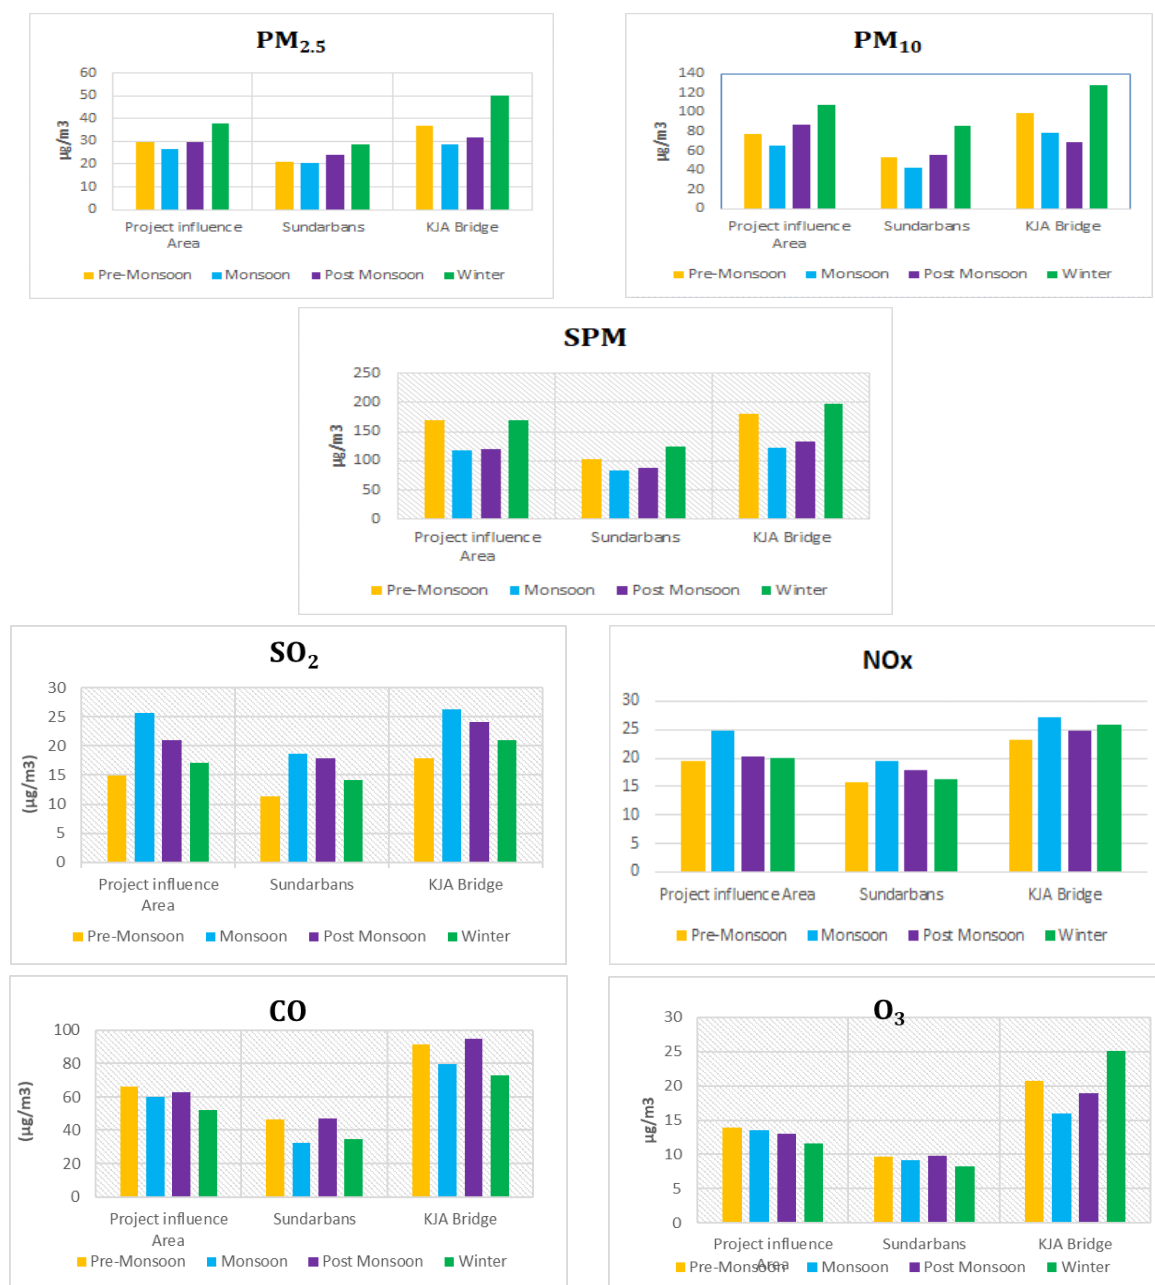

The values of all the criteria pollutants as averaged for the corresponding locations for the corresponding seasons were found to be higher in Khan Jahan Ali Bridge area than the project influence area followed by the Sundarbans reserve Forest (SRF) area. On the other hand, the concentration of the measured parameters was found to be higher in winter seasons of the monitoring periods except for  $\text{SO}_x$ ,  $\text{NO}_x$  which found to be higher in monsoon periods and CO concentration was found higher in post monsoon seasons. It can be mentioned here that the concentration was always observed to be much lower in SRF area than the other areas and never exceeded comparing to the standards set by DoE (ECR, 1997) (**Figure 2.3**).

**Table 2.2: Air Quality Monitoring Results (31<sup>st</sup> Quarterly Program)**

Sl. No.	Location	PM <sub>2.5</sub> (µg/m <sup>3</sup> )		PM <sub>10</sub> (µg/m <sup>3</sup> )		SPM (µg/m <sup>3</sup> )		SO <sub>2</sub> (µg/m <sup>3</sup> )		NO <sub>x</sub> (µg/m <sup>3</sup> )		CO (mg/ m <sup>3</sup> )		O <sub>3</sub> (ppb)

Source: CEGIS field survey; STD\*-Standard

**Figure 2.3: Seasonal Variation of the Air Quality Parameters**

Cluster analysis was performed to identify the grouping pattern of the criteria pollutants along with their corresponding locations. Euclidean distances were observed to measure the distances among the objects using as variables (annual average concentrations of the seven studied variables for every station). According to the dendrogram (**Figure 2.4.**) Hiron point (L10), Akram Point (L9) and Harbaria (L8) represents the locations of minimum pollution level situated inside the Sundarbans Forest area and are away from the nuclei of Mongla industrial zone and the project site. On the other hand, Chalna (L6), Mongla Ghat (L7) and Khan Jahan Ali Bridge in Khulna (L11) are subjected to higher in population density and increased industrial activities among all sites whereas Maidara (L1), Shapmari (L2), Koigardashkatir char (3), Gaurambha (L4) and Bajua (L5) represent lower or moderate commercial activities (**Figure 2.4**).

**Figure 2.4: Dendrogram of the Monitoring Stations using Euclidean Distance**

### 2.1.6 Findings

According to the observed data it can be concluded that the concentration of major air pollutants was found comparatively lower in the Sundarbans area than that of the other monitoring locations. But due to the seasonal effect the concentration of the particulate matter was found to be slightly higher at Khan Jahan Ali Bridge area though is comparable to the standards set by DOE. On the other hand, the concentration of SO<sub>2</sub>, NO<sub>x</sub>, CO and O<sub>3</sub> were found higher in the township area than the other locations but much lower than the standards set by ECR'97 (Amended). However, major sources of criteria pollutants generation in and around the project site as observed were the piling activities, digging, tunnelling and burrowing works, jetty erection activities, major construction works, dust from unpaved roads and vehicle movement, construction materials and goods transportation activities through the roads and river Passur etc. Other sources of pollutants which may contribute to the existing pollution load are the small industries like cement works and refinery industries etc., diffuse sources like wood stoves, fires and wind generated dust etc.

## 2.2 Noise Quality

Noise is the sound that is not wanted by the perceiver, because it is unpleasant, loud, or interferes with hearing. By extension, in experimental sciences, "noise" refers to any random fluctuations of data that makes more difficult the perception of an expected signal. From a physics standpoint, noise is indistinguishable from sound as both are vibrations through a medium, like air or water. In general point of view, noise is the chaotic feeling of sound where many sound waves are mixed and difficult to distinguish a single signal. Noise is described by a weighted sound intensity (or level), which represents sound heard by the human ear and is measured in units called decibels (dBA). However, engine boats, trawlers, small barges, ships plying over the waterways, birds' chirping, stormy wind, falling of leaves from the trees and the wave breaking sound were the main source of noise generation in and around the Sundarbans. On the other hand, construction activities, the urban and rural vehicles i.e. buses, trucks, local human haulers, auto-rickshaws, motorized vans, motorbikes etc. were much noticeable in the outside of Sundarbans area.

### 2.2.1 Methodology

Noise levels were measured thrice in a day (morning, afternoon and evening) at eight locations, twice (morning & noon) at three locations. Each time, noise levels were recorded using sound level meter for five minutes of time span with an interval period of 30 second and the noise meter was properly set up and calibrated following the instruction manual. On the other hand, the monitoring locations were selected considering the sensitivity of the nearest receptors. The ambient noise level acquisition activities are shown in **Figure 2.5**.

**Figure 2.5: Ambient Noise Acquisition**

### **2.2.2 Sources of Noise in the study area**

Among the sources of noise generation engine boats, trawlers, small barges, ships plying over the waterways, birds' chirping, stormy wind, falling of leaves from the trees and the wave breaking sound were the main source of noise generation in and around the Sundarbans. On the other hand, construction activities, the urban and rural vehicles i.e. buses, trucks, local human haulers, auto-rickshaws, motorized vans, motorbikes etc. were much noticeable around the project area.

### **2.2.3 Locations of Noise Level Monitoring**

Out of (11) locations, three (03) locations were inside the Sundarbans, six (06) locations were in and around the Project site, one at Khan Jahan Ali Bridge and the remaining one was at Mongla Ghat area (Figure 2.6 and Table 2.3).

**Table 2.3: Noise Monitoring Plan**

SL. No.	Monitoring locations	GPS points	Time of noise monitoring
1	South West corner of the Project boundary	89°33'34.5"E; 22°34'33.8"N	Morning, Noon and evening
2	Proposed township area near Chimney location, Mauza: Sapmari Katakhal	89°32'3.8"E; 22°36'32.5"N	Morning, Noon and evening
3	North West corner of the Project boundary (Kaigar Daskati)	89°33'51.8"E; 22°36'1.06"N	Morning, Noon and evening
4	Barni, Gaurambha union (4km North East from the chimney location)	89°34'37.7"E; 22°38'51.8"N	Morning, Noon and evening
5	Chunkuri-2, Bajua Union (4km South West from the chimney location)	89°34'01.1"E; 22°32'3.3"N	Morning, Noon and evening
6	Pankhali, Dacope, (4km North West from the Chimney location)	89°31'24.2"E; 22°36'6.7"N	Morning, Noon and evening
7	Mongla Port Area	89°35'50.4"E; 22°28'24.8"N	Morning, Noon and evening
8	Harbaria, Sundarbans	89°35'34.2"E; 22°17'43.1"N	Morning and Noon
9	Akram point, Sundarbans	89°30'54.1"E; 22°23.50"N	Morning and Noon
10	Hiron Point, Sundarbans	89°27'53.2"E; 21°46'27.60"N	Not monitored
11	Khulna city near Khan Jahan Ali Bridge	89°35'35.5"E; 22°46'36.8"N	Morning, Noon and evening

### 2.2.4 Status of Noise

In order to provide an overview of the observed noise data set, the average values for the respective locations have been appended in **Table 2.4** for ready reference; but the detailed noise level data have been attached in **Table C1, C2, C3, C4, C5, C6, C7** and **C8** respectively in the **Appendix IV**.

However, the Department of Environment of the People's Republic of Bangladesh, an agency under the Ministry of Environment and Forests has set up the standard of permissible limits of noise level at day time for different classified areas. According to Bangladesh Noise Pollution Control Rules (2006), the eleven monitored locations fall under different classified area like residential, commercial, mixed, silent and industrial class.

Observed noise level at *Chalna*, a commercial area located at a distance of 4 km to the north-west direction of the proposed chimney location was recorded as 59.71dB whereas it's standard level is 70 dB (**Table: 2.4**). Levels of noise at *Kaigar Daskati* (48.82 dB) situated at the Gucchha Gram, a residential area located at north-west corner of the project area; Chunkuri-2 (49.01 dB) located at 4km south-west direction from the chimney location; *Maidara Khal* (54.65 dB), south-west corner of the project area and a residential area and; *Shapmari* (50.03 dB), proposed township area didn't cross their corresponding standard limits (55 dB) of noise level (**Table: 2.4**). The level of noise at *Barni (Gaurambha)* was found to be 48.89 dB which was 11.11 dB lower than that of standard limit (60 dB) of noise level for this location (**Table: 2.4**). *Harbaria* (47.31 dB), *Akram Point* (37.41 dB) and *Hiron Point* (36.29 dB), the three ecologically silent zone were also not found to exceed the Bangladesh standard limit (50 dB) of their corresponding standard values (**Table: 2.4**).

On the other hand, observed noise levels at Khan Jahan Ali Bridge (62.33 dB), a commercial zone, and Mongla Port (55.95 dB), an industrial zone, were also not found to exceed the Bangladesh standard limit of noise at their corresponding values (Table: 2.4). The standard noise limits for Khan Jahan Ali Bridge and Mongla Port during the day are 70 dB and 75 dB, respectively.

**Figure 2.8: Status of average Noise Level at the Monitoring Locations (31<sup>st</sup> quarter)**

### 2.2.5 Findings

The noise generation sources in the study area can mainly be divided into two types; one is natural and the other one is anthropogenic. Natural sources of noise generation were birds' chirping, stormy wind, wave breaking on the shoreline, howling of leaves and so on. On the other hand, traffic mobilization, industrial activities, vessels movement within the rivers and local vehicles were the anthropogenic sources of noise. However, the observed noise level was not found to exceed the Bangladesh standard limit of noise level (Table 2.4).

## 2.3 Water Quality

An updated water quality status of the Passur-Sibsa River system and adjacent water bodies have been depicted in this section. Both the national and international guidelines were followed and adopted for sample collection as well as analysis. This report includes physical water quality parameters collected during 31<sup>st</sup> quarterly monitoring tier (January, 2022) and the tested results obtained from the laboratory up to October, 2021 (30<sup>th</sup> quarterly monitoring). A number of identical parameters as well for the selected locations to understand the effect of power plant activities on the surface and groundwater quality which may affect the aquatic life of the adjacent river, the Sundarbans Forest ecosystem and community health in and around the power plant area.

### 2.3.1 Methodology

The procedure for water quality monitoring covers selection of water quality parameters, identification of sampling locations, determination of sampling frequency and evaluation criteria of the monitoring parameters etc. Standard approaches and methodologies were followed for the above-mentioned events. Both the surface and groundwater quality status of the water bodies in and around the Power Plant and the Sundarbans area were examined. The monitoring results are presented and compared with the national standards (ECR, 1997 and all available amendments). The samples were collected from eighteen (18) pre-selected locations (15 locations for surface water along the Passur River from Chalna to Hiron Point of Sundarbans, Sibsa River near Akram Point, Maidhara River near the project area and 3 locations for groundwater i.e. project area, Kapashdanga and Rajnagar). The standard sampling procedure was followed

for both surface and groundwater sampling to reduce the possibility of any error. Each sample was labelled at the time of sampling. The selected monitoring locations for the monitoring program are shown in **Figure 2.9**. The details of the monitoring plan covering sampling locations, geographical locations, frequency and analysis techniques of sampling for surface and groundwater are given in **Table 2.5** and **Table 2.6** respectively.

**Table 2.5: Groundwater Quality Monitoring Parameters, Locations and Plan**

Sl. No.	Locations	GPS (Decimal Degree)		Frequency	Methods/Monitoring indicators/ Techniques
		Easting	Northing		
1	Near Proposed Township Area	89.566139°E	22.594167°N	Quarterly	In-situ testing of physical water quality parameters was done by Horiba U-50 multi-meter. Preservation of samples and Laboratory analysis were carried out at DPHE Central Laboratory and BCSIR
2	Rajnagar	89.576056°E	22.612528°N		
3	Kapasdanga	89.563000°E	22.622528°N		

### 2.3.2 Selection of Parameters

The selected parameters for Ground water quality monitoring include pH, Temperature, Dissolved Oxygen (DO), Total Dissolve Solids (TDS), Total Hardness (TH), Chemical Oxygen Demand (COD), Salinity, Nitrate ( $\text{NO}_3^-$ ), Phosphate ( $\text{PO}_4^{3-}$ ), Sulphate ( $\text{SO}_4^{2-}$ ), and Heavy Metals (As, Pb, Hg) etc.

#### *Surface Water Quality Parameters*

The selected parameters for surface water quality include Temperature, pH, Dissolved Oxygen (DO), Total Dissolve Solids (TDS), Total Suspended Solids (TSS), Total Hardness (TH), Turbidity, Chemical Oxygen Demand (COD), Salinity, Nitrate ( $\text{NO}_3^-$ ), Phosphate ( $\text{PO}_4^{3-}$ ), Sulphate ( $\text{SO}_4^{2-}$ ), Heavy Metals (As, Pb, Hg), and Oil and Grease. The parameters were categorized into 4 groups:

- Physical and aggregate properties i.e. pH, Temperature, Salinity, Hardness, TDS, TSS, Turbidity, Oil & Grease;
- Inorganic non-metallic constituents i.e., DO,  $\text{NO}_3^-$ ,  $\text{PO}_4^{3-}$  and  $\text{SO}_4^{2-}$ ;
- Aggregate organic constituents i.e. COD and
- Heavy metals i.e. As, Pb and Hg;

However, some additional parameters i.e., PAH (Polycyclic Aromatic Hydrocarbons), TOC (Total Organic Carbon) and TC (Total Carbon) were included in the monitoring study as per recommendation of the DoE approved coal transportation study monitoring framework as well as approval condition no. 26 and accordingly the analysed data of the additional parameters are recorded and submitted to the DoE and other concerned authorities periodically.

#### *Groundwater Quality Parameters*

The selected parameters for Ground water quality monitoring include pH, Temperature, Dissolved Oxygen (DO), Total Dissolve Solids (TDS), Total Hardness (TH), Chemical Oxygen Demand (COD), Salinity, Nitrate ( $\text{NO}_3^-$ ), Phosphate ( $\text{PO}_4^{3-}$ ), Sulphate ( $\text{SO}_4^{2-}$ ), and Heavy Metals (As, Pb, Hg) etc.

15		Passur river at Hiron point of the Sundarbans Reserve Forest Area	21.774183°N	89.464778°E		

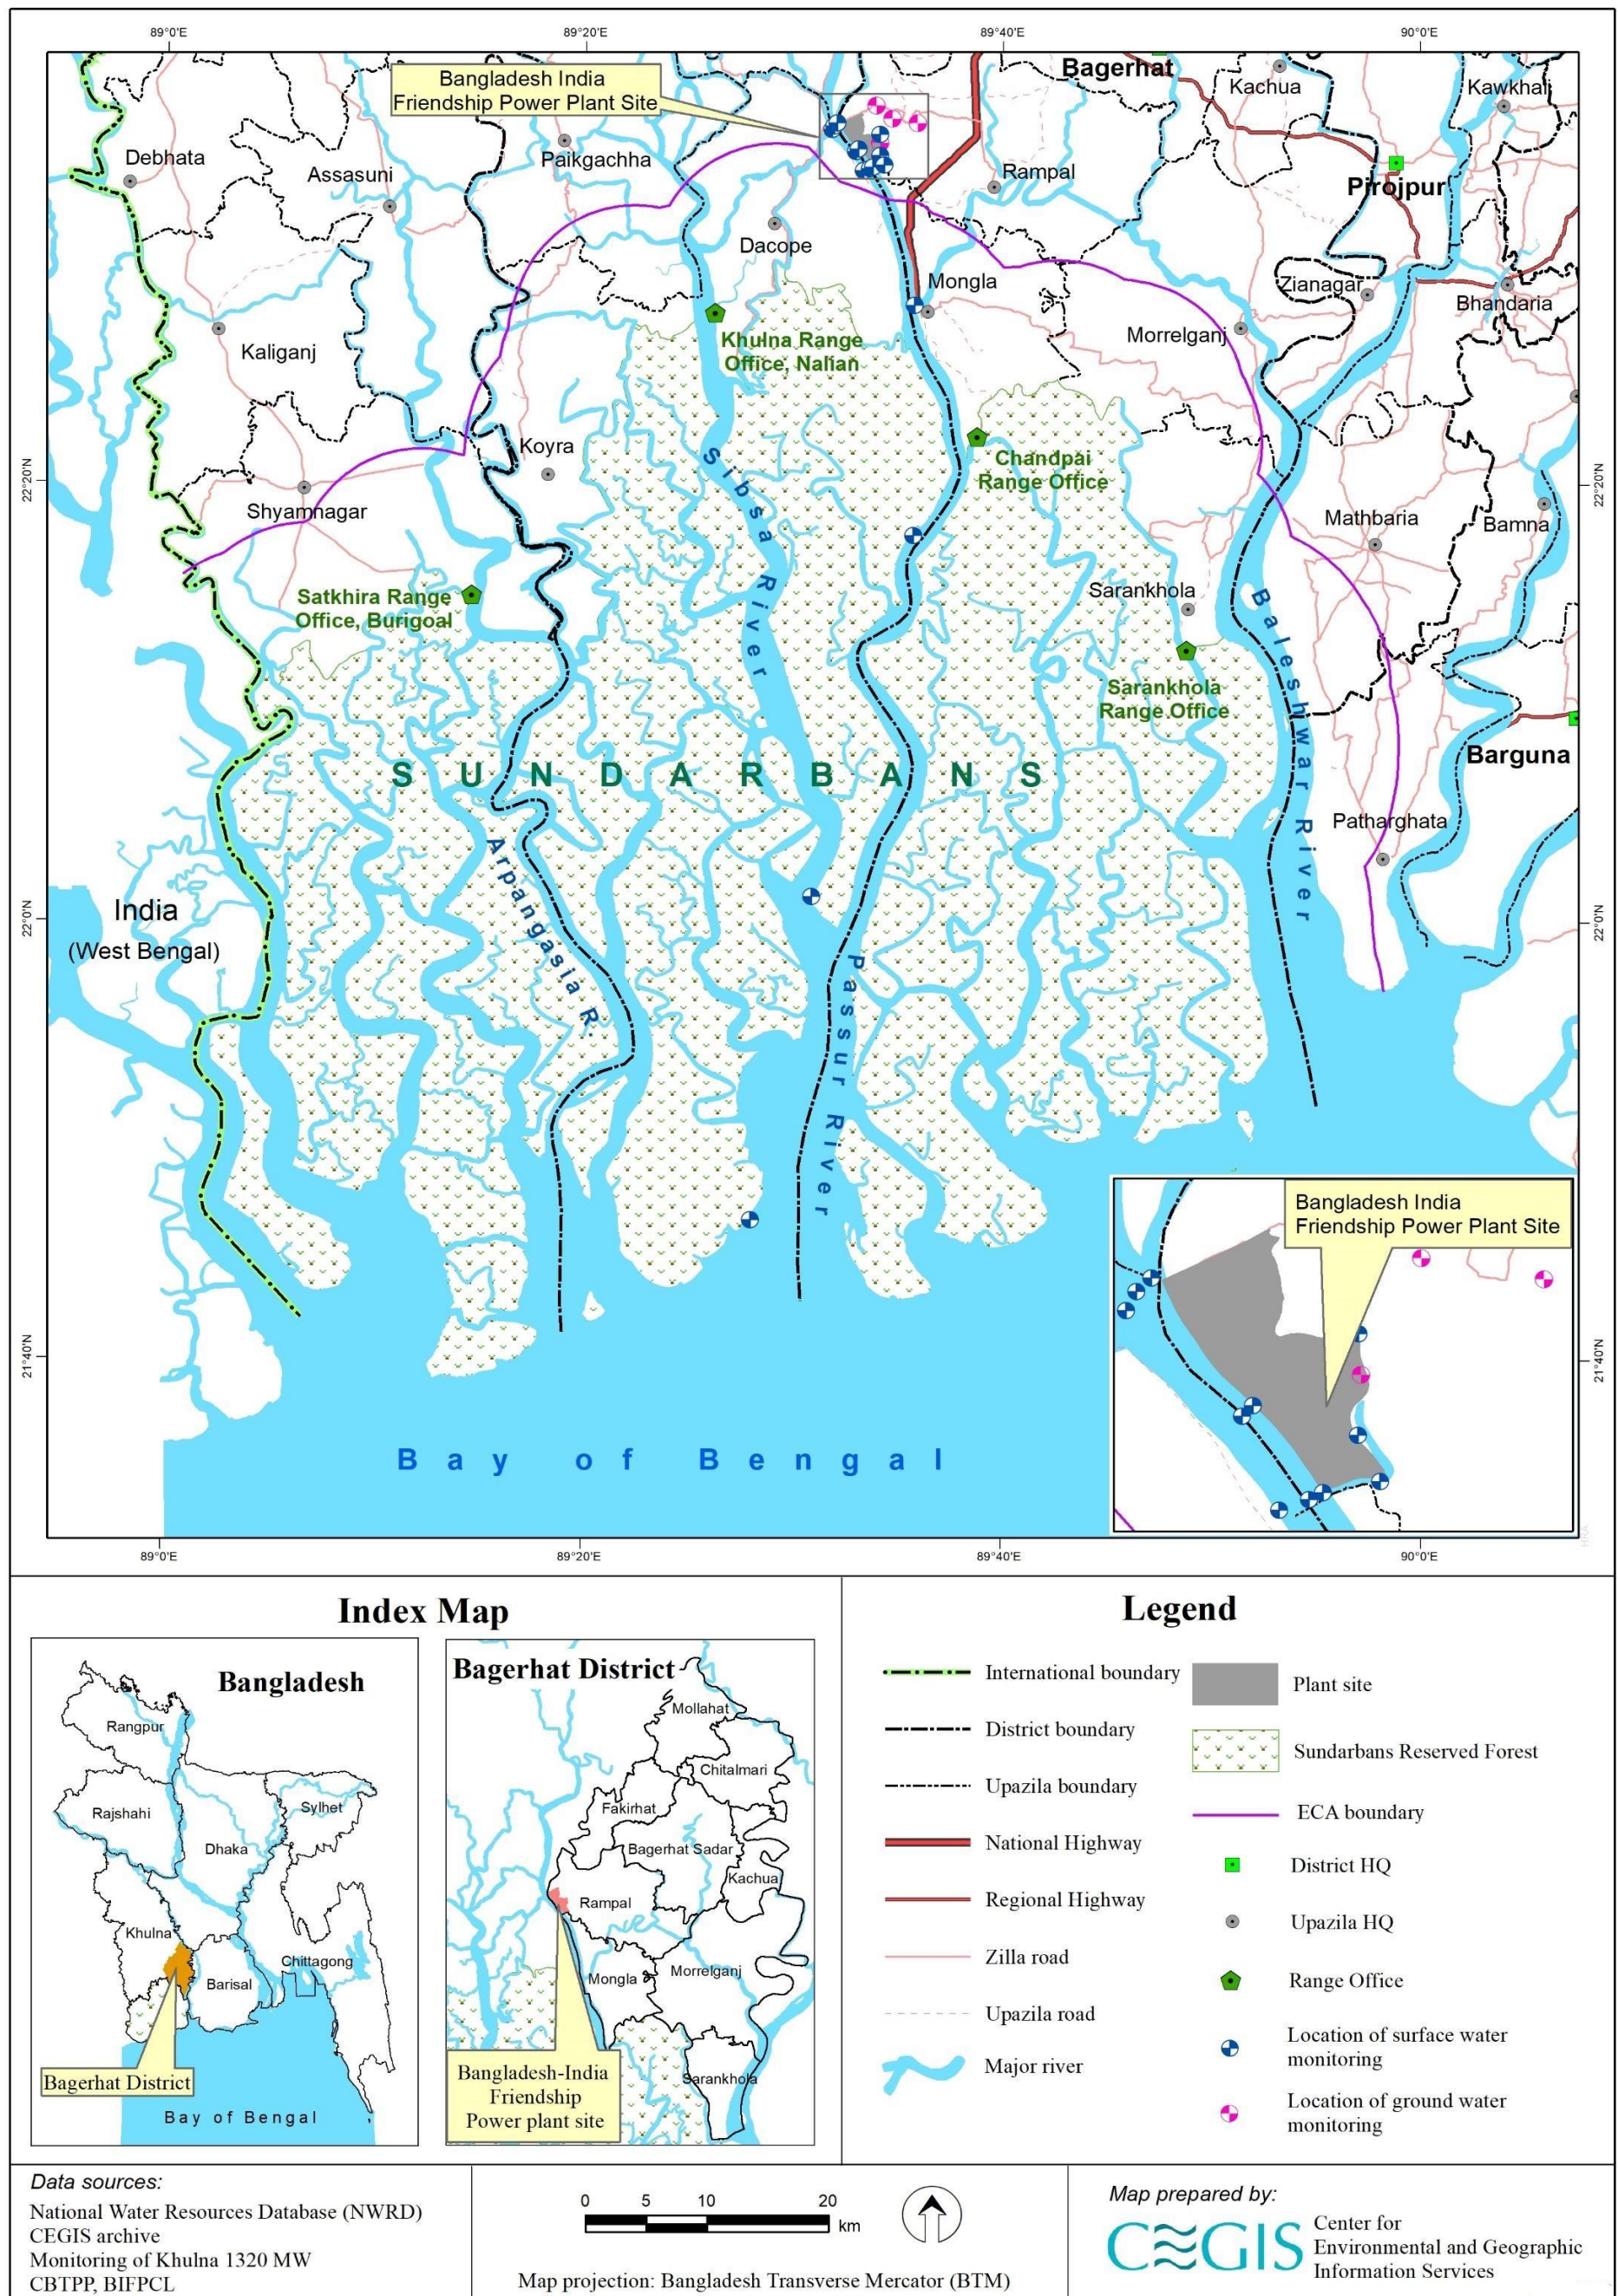

Figure 2.9: Surface Water and Groundwater Quality Monitoring Location

### 2.3.3 Surface Water Sampling Procedure

The study area is highly influenced by tidal variation. Hence, temporal and spatial variations of tides were considered in sampling procedure. Surface water samples were collected at a distance of 30-50m away from the riverbank and at a depth of 6 cm below the water surface during low tides or relative slag period after the low tide for all parameters except oil and grease. The non-acidified sampling bottles were rinsed with respective water samples before sampling. Acidified sampling bottles were used for heavy metal (As, Pb, Hg) sample collection. On the contrary, Analysis of BOD<sub>5</sub> has been discarded because of constraints to maintain the proper procedure to collect, preserve and lab testing the water samples at ideal condition. All samples were preserved as per standard procedure. The in-situ testing of the water quality parameters are shown in **Figure 2.10**.

On the other hand, the groundwater samples were collected from hand operated tube wells after 5-7 minutes of water extraction. Each sampling bottle was rinsed with respective water samples before sample collection and storing. Acidified sampling bottles were used for heavy metals (As, Pb, Hg) sample collection and were preserved following standard procedure.

**Figure 2.10: Insitu Testing of Water Parameters**

### 2.3.4 Water Quality Parameter Analysis Techniques/Methods

Water quality parameters were analysed as per the procedure of American Public Health Association (APHA) standard. The analysis procedures of different parameters along with the standards are given in **Table 2.7**.

**Table 2.7: Testing Methodology of Water Quality Parameter**

Parameters	Methods/Measuring Tools	Unit	BD Standard (ECR 1997)
Temperature	Horiba U-50 multimeter	°C	20 - 30
pH	Horiba U-50 multimeter	-	6.5-8.5
TDS	Horiba U-50 multimeter	ppm or mg/L	2100 (SW), 1000 (GW)
TSS	Horiba U-50 multimeter	ppm or mg/L	150 (SW), 10 (GW)
Salinity	Horiba U-50 multimeter	ppt	-
DO	Horiba U-50 multimeter	ppm or mg/L	6
BOD <sub>5</sub>	5-Day BOD Test at 20°C	ppm or mg/L	50 (SW)

Parameters	Methods/Measuring Tools	Unit	BD Standard (ECR 1997)
COD	Closed Reflux Method	ppm or mg/L	200 (SW), 4.0 (GW)
Total Hardness (as CaCO <sub>3</sub> )	Titrimetric	ppm or mg/L	200-500
Ortho-Phosphate (PO <sub>4</sub> <sup>3-</sup> )	UV-VIS Spectrophotometers	ppm or mg/L	6
Nitrate (NO <sub>3</sub> <sup>-</sup> )	UV-VIS Spectrophotometers	ppm or mg/L	10
Sulphate (SO <sub>4</sub> <sup>2-</sup> )	UV-VIS Spectrophotometers	ppm or mg/L	400
Oil and Grease	Liquid-liquid extraction with hexane, treatment with silica gel and gravimetric determination	ppm or mg/L	10 (SW)
Arsenic (As)	Atomic Absorption Spectrophotometers-Hydride Vapor Generating (AAS-HVG)	ppm or mg/L	0.05
Lead (Pb)	Atomic Absorption Spectrophotometers-Graphite Furnace (AAS-GF)	ppm or mg/L	0.05
Mercury (Hg)	Mercury Analyzer	ppm or mg/L	0.001
PAH	APHA 5310.B	mg/L	N/A
TOC and TC	APHA 5310.B	mg/L	N/A

### 2.3.5 Water Quality Reporting Arrangement

Water quality status of the adjacent water bodies of power plants and the Sundarbans Reserve Forest (SRF) are being observed since April, 2014. The 31<sup>st</sup> quarterly report covers yearly variations of post-monsoon (August-October, 2021) for chemical water quality status and yearly variations in winter (November, 2021-January, 2022) for physical water quality status are presented and compared with the ECR' 1997 Standards. To do so, all sampling points are clustered in five different sampling sites considering homogenous characteristics of the sampling points as well as the type of ecosystem touching the sample points. The clustered sample monitoring sites and the logical explanation of the clusters are presented in the following Table 2.8.

**Table 2.8: Monitoring Sites and Characteristics**

SL	Monitoring sites	Site Characteristics
(a)	<b>Power plant &amp; adjacent areas</b>	Total 11 sampling points were selected and the values were averaged to represent the water quality status of power plant adjacent surface water bodies. These 11 sampling points are situated in the same river system or network and embedded within 1km radius of power plant area. Therefore, this study makes the clusters to represent the water quality status of the areas in a more explainable and understandable way.
(b)	<b>Mongla-Passur confluence</b>	This monitoring site is situated at least 13km downstream of the power plant. This point is a confluence area of Passur river and Mongla-Ghasiakhali channel. Around this point, the terrestrial ecosystem is mostly dominated by agricultural lands followed by rural settlements.
(c)	<b>Harbaria</b>	Harbaria site is situated around 15 km downstream of the Mongla/Ghasiakhali and Passur confluence. This site is dominated by Sundarbans Forest and heavily influenced by the activities of mother vessels unloading and small cargo movement for carrying of clinker, coal and LPG gas. It is to be noted here that the tidal effects of Bay of Bengal is very prominent here.
(d)	<b>Akram point</b>	Akram point is located around 35 km downstream of the Harbaria point. This site is situated at the confluence point of Passur and Sibsa river. This site is completely dominated by deep forests ecosystems. Influenced by tidal effects of Bay of Bengal.
(e)	<b>Hiron Point</b>	Hiron point is the furthest point of this surface water-monitoring scheme. This point is at 25 km downstream of the Akram point. Deep forests and marine habitats are the main characteristics of the site. This site is completely exposed to the Bay of Bengal.

### Status of Surface Water Quality

#### In-situ tested parameters

The in-situ tested results obtained up to 31<sup>st</sup> monitoring period (November, 2021- January, 2022: winter season) are described below:

#### *pH*

During the visit, pH values in the monitoring sites were ranged between 8.1 and 7.5 and altogether the pH value (Values averaged for 11 locations) was almost 7.8 near the power plant areas whereas 6.7 at Hiron point of Sundarbans. However, the pH values of surface water monitoring data have been found within the standard limit of ECR, 1997 Standard (6.5-8.5). The highest value (8.1) was found at Left Bank of Passur River at Project Site-Jetty and lowest (7.5) was observed at Passur River at Hiron point of Sundarbans. However, the values indicated slightly basic in nature during the post- monsoon.

The pH values of monsoon and post-monsoon seasons were found to be comparatively lower than those of the pre-monsoon and winter seasons (**Table B.1: Appendix-IV**) which might be due to the decreased river water level during pre-monsoon and winter season triggered by inadequate rainfall and insufficient inflow from U/S (upstream) of Passur-Sibsa RS (River System) which has also been reported by others (*Rahman et al., 2013*). Fluctuations in pH values during different season of the year can be attributed to factors like removal of CO<sub>2</sub> by photosynthesis through bicarbonate degradation, dilution of waste with freshwater, reduction in salinity and temperature, and decomposition of organic matter (*Rajasegar, 2003*).

Seasonal variations in pH concentrations among the selected monitoring sites during the quarterly monitoring programs of the previous years of Passur-Sibsa RS are presented in **Figure 2.11** and the observed dataset are attached in **Table B.1 of Appendix- IV**.

#### *Temperature*

During the monitoring period the temperature varied from 21°C -24°C among the monitored sites. The maximum water temperature (24°C) was recorded at Passur River at Harbaria of Sundarbans. According to the ECR, 1997, 30°C water temperature is still be tolerable by the aquatic organisms in tropical environment. However, during the pre-monsoon seasons in Passsur River there were some sites showed increasing pattern of temperature especially nearby the Power Plant and adjacent area rather than the ECR limit which could be the high salinity and hot climate prevailing at that area. However, currently the power plant is not discharging any hot water into its surrounding environment as it is still in construction phase.

The surface water temperature largely depends on daily weather condition (*Bartram. J. et. al., 1996*). According to the seasonal weather pattern of Bangladesh the temperature drops to a minimum level during winter, which is also applicable for the water temperature and thus it differs largely than the other season's temperatures. Recorded temperatures indicated that there was spatial variation among the monitoring sites even in the same seasons.

Seasonal variations in surface water temperature in the selected sites during the quarterly monitoring of previous years are presented in **Figure 2.12** and all the observed dataset are attached in **Table B.2 of Appendix- IV**.

#### *Salinity*

The observed salinity concentration ranged between 0.2 ppt. and 8.0 ppt. during the last monitoring season. The maximum salinity (8.0 ppt.) was observed at Hiron point in the Sundarbans while minimum was at Maidara River near Power plant areas. Insufficient fresh water flow from upstream section of the river system increase the salinity concentrations during winter and pre- monsoon seasons.

In general, high salinity from sea water increased water salinity in the direction of downstream to upstream. In the monitored river systems, the highest salinity was observed in pre-monsoon season

followed by winter season where monsoon reflects the lowest. Freshwater flow from upstream and the dominated towards the sea water are the main reason of low salinity concentration in monsoon. However, the water salinity data in the selected sampling stations of Passur-Sibsra RS of the previously monitoring periods are presented in **Figure: 2.13** and all the observed dataset are attached in **Table B.3 of Appendix-IV**.

#### *Dissolved Oxygen*

The standard DO level for the fisheries in aquatic environment is more than 5.0 mg/L (ECR'1997). In the last monsoon season, DO values ranged from 5.5 mg/L to 7.1 mg/L which was found within the permissible limit recommended by DoE. The average DO value of 6.5 mg/L was found near the power plant sites which was relatively same (6.3 mg/L) inside the Sundarbans. Higher DO level was observed in monsoon and post-monsoon season basically for heavy rainfall and freshwater availability. During winter, salinity affects the temperature and then water temperature affects the holding capacity of DO in the River water. Seasonal variations of DO at the monitoring sites of Passur-Sibsra RS for the monitoring periods are shown in **Figure: 2.14** and all the observed dataset are attached in **Table B.4 of Appendix- IV**.

#### *Laboratory tested parameters*

The laboratory tested results obtained up to 30<sup>th</sup> monitoring period (Oct, 2021: post-monsoon) are described below:

#### Total Dissolved Solids (TDS), Total Hardness (TH) and Total Suspended Solids (TSS)

TDS mainly indicates the presence of various kinds of minerals like ammonia, nitrate, phosphate, alkalis, some acids, sulphates and metallic ions etc., in water which comprise both colloidal and dissolved solids in water (Tareq. M. S. *et al.*, 2013). During the last visit, the TDS values were found to be ranged between 147-

6300 mg/L (**Figure 2.15**). In general, the TDS values increase in Pre-monsoon and winter seasons than in monsoon and post-monsoon periods which could be the contribution of less rainfall and decreased upstream flow to its dilution in the rainy season (Izonfuo and Bariweni, 2001)<sup>1</sup>. TDS values in Passur River increased as it progressed toward the Sea. Therefore, Hiron point showed the highest TDS with respect to remaining sampling point. **Table B.8: Appendix IV**. Regarding spatial variation, towards downstream of the RS, usually high TDS concentrations due to tidal influence of the Bay of Bengal that contains lots of salts and other nutrients.

**Total Hardness (TH)** follows similar pattern as that of TDS e.g., high TH during pre-monsoon and winter season as the higher the TDS, the higher the nutrients and therefore higher occurrence of TH. Insufficient freshwater supply due to low rainfall during winter and pre-monsoon period increase the TDS concentrations in the Passur-Sibsa RS. Seawater contains huge quantity of minerals including calcium and magnesium, which make the water hard. During the post monsoon period the TH values were found to be ranged between 125 mg/L to 1450 mg/L. In the deep Sundarbans hardness always found to be comparatively higher than the standard value of surface water (**Figure 2.16**). Generally, water hardness is found to be higher in monsoon season but in Passur River, it is found to be higher in pre-monsoon season due to the saline water intrusion toward upstream (Rahman et al., 2013).

**Total Suspended Solids (TSS)** include solid materials of organic and inorganic in origins, which are normally suspended in water. In the Passur-Sibsa RS, the suspended matters generally contain sand, clay, silt and loam. TSS concentrations among the monitoring sites varied from 4 mg/L to 17 mg/L observed in the last monitoring results. TSS values recorded during the last post monsoon period found to be within the permissible limit of 150 mg/L (ECR, 1997). In 2014, TSS reached more than 150 mg/L at Mongla-Passur Confluence due to the oil spillage incident occurred at 9<sup>th</sup> December, 2014 (**Figure 2.17**). After that, the issue was not found any more, and the water bodies reinstated its properties naturally. Above all, in the Passur-Sibsa RS, TSS showed consistency in the concentrations of suspended matters.

Generally, in the Passur-Sibsa RS, TSS was found to be higher in post-monsoon and winter seasons than those of pre-monsoon and monsoon. During post-monsoon and winter season, the TSS value increases, probably due to relatively low precipitation and less upstream freshwater flow, urban runoff, industrial wastes, bank erosion, bottom feeders (such as carp), algae growth or wastewater discharges.

The status of TDS, TH and TSS of Passur River in the observed winter seasons at different monitoring sites are presented in **Figure 2.15**, **2.16** and **2.17** respectively and all the observed dataset are attached in **Table B.8**, **Table B.9** and **Table B.10** of **Appendix- IV**.

#### Chemical Oxygen Demand (COD)

COD is an indicator of organic pollution, which is caused by the inflow of natural organic loads, domestic, livestock and industrial wastes, which contain elevated levels of organic pollutants (Ayati, 2003). In fact, the higher the organic matter, the higher will be the decomposition and hence there will be a higher demand of O<sub>2</sub> in the water body.

COD concentrations varied from 4 mg/L to 192 mg/L during the last post-monsoon season (**Figure 2.18**). The highest value was found at Akram Point while the lowest value was found in Passur River near the Power Plant area. The higher values of COD indicate high level of organic pollution in the river water (Sivasubramaniam, 1999). **Figure 2.18** indicates that, organic loads are higher in the deep forests of Sundarbans than the upstream areas especially the power plant and its adjacent areas. Deep forests supply many organic loads in the river while upstream loads as well increase the organic materials concentrations in huge at the downstream of the RS. COD concentrations of all the monitoring sites found slightly higher than the Draft ECR' 2017 (25 mg/L).

<sup>1</sup> Izonfuo W. A and. L Bariweni 2001. The effect of urban runoff water and human activities on some physicochemical parameters of the Epie creek in the Niger Delta. J. Appl. Sci. & Enviro. Mgt, **5(1)**: 4755.

Over the year, COD concentration was found to be higher in pre-monsoon season followed by winter as these seasons had insignificant rainfall comparing to those of other seasons and which actually increased the density of organic matter. The COD concentrations of pre-monsoon and winter seasons (dry) were found higher than those of monsoon and post-monsoon seasons. In monsoon, higher discharge diluted the COD load of the river water, which in turn reduced COD concentration in post monsoon. All observed values of COD are shown in **Figure 2.18** and the completely monitored dataset are provided in **Table B.6 of Appendix- IV**.

#### Nitrate, Sulphate and Phosphate

During monsoon the highest nitrate value was found to be 12.6 mg/L at Akram point and lowest value was found to be 0.1 mg/L at Maidara River near Shapmari. Among the monitoring results, the highest values were found in pre-monsoon season of 1<sup>st</sup> quarter of 2<sup>nd</sup> year, which would be due to the higher amount of surface and groundwater runoff, dissolution of nitrogen-rich geological deposits, and biological degradation of organic matter (Hiron point in 2015) as observed from numerous studies (Spencer, 1975; Kinne, 1984; Gleick, 1993; Wetzel, 2001; Rabalais, 2002) (**Table B.11 of Appendix-IV**). High nitrate concentration was found in monsoon period across the Passur-Sibsa RS, which would be the result of surface run-off, agricultural run-off, atmospheric deposition and domestic wastes dumping together with industrial pollution from upstream.

Naturally, sulphate ( $\text{SO}_4^{2-}$ ) concentration is higher in seawater as well as in coastal river due to tidal influence. The monitored dataset substantiates this fact i.e.,  $\text{SO}_4^{2-}$  concentration of Passur-Sibsa RS increases in the direction of upstream to downstream. However, this variation is visible clearly in monsoon and pre-monsoon seasons only. Freshwater availability from upstream makes this variation. During the monitoring tier sulphate concentration was found to be higher in Harbaria (244 mg/L) and lowest (89 mg/L) at left bank of Pasur River near Jetty site.

On the other hand,  $\text{PO}_4^{3-}$  concentrations was found highest (1.5 mg/L) during the last monitoring period (Post-monsoon, 2021) However, the recorded low phosphates value during dry seasons might be attributed to the limited flow of upstream freshwater, high salinity and utilization of phosphate by phytoplankton, stated by Senthilkumar et al., 2002; Rajasegar, 2003 (**Table B.11**).

$\text{NO}_3^-$ ,  $\text{SO}_4^{2-}$  and  $\text{PO}_4^{3-}$  concentrations at different monitoring sites are shown in **Figure 2.19**, **Figure 2.20** and **Figure 2.21** and all the observed dataset are given in **Table B.11**, **Table B.12** and **Table B.13 of Appendix- IV**.

#### Heavy Metals

Arsenic (As) concentrations varied between 0.002 to 0.003 mg/L. During the monitoring, the results again fitted with the said range. Seasonal variations in arsenic were due to seasonal differences in riverine input and the intrusion of water masses (Yuan, et al., 2021). Higher As concentration at Hiron point in 2020 might be due to the less rainfall and higher seawater intrusion. On the other hand, the concentration of Pb ranged from 0.002 to 0.019 mg/L (**Figure 2.23**). Lead (Pb) dissolved in water is very harmful to aquatic organisms; due to bioaccumulation, it increases in body tissue of organisms (Rompas, 2010). It is also evident that organic fertilizer, which comes from lime and compost fertilizers, can contain heavy metal, e.g., NPK fertilizer (phosphate fertilizers containing Pyromorphite-  $\text{Pb}_5(\text{PO}_4)_3$  like the way said by Zhu et. al., 2004), which may result in higher amount of Pb concentration in river water. On the contrary, the values of Mercury (Hg) revealed consistency among all the monitoring points in all the seasons in all monitoring quarters. The values never exceeded 0.001 mg/L. In the last post-monsoon, the concentrations also remain same. All the observed data are found to be within the permissible limit (0.05 mg/L) as per ECR, 1997.

The average value of As and Pb concentrations at different monitoring sites of the consecutive monitoring quarters for winter season are presented in **Figure 2.22** and **2.23** and all the observed dataset are given in **Table B.14**, **Table B.15** and **Table B.16 of Appendix- IV**.

### Oil and Grease

In order to measure the concentration of oil and grease in Passur-Sibsa River, samples were collected at five locations during low tide from the surface layer and analysed following the standard testing method of APHA. The concentration of oil and grease are presented in **Table-B.7 of Appendix-IV**. During monsoon and post monsoon periods, the concentration of oil and grease were found lower than that of winter and pre-monsoon season. It appears from the data that Passur and Sibsa river system recorded high concentration of oil and grease in winter period in 2014, which might be due to accidental oil spillage occurred on December 9, 2014. An amount of 350,000 litres (Philips, 2014) of furnace oil had spilled in the river and spread over an area of 350 km<sup>2</sup> (Welle, 2014). During the last monitoring period, Oil and grease was found <2.0- mg/L for all the monitoring sites. Plying of motorized boats, launches and other tourist boats, Navy boats and fishing boat at Dublar char could be the reasons of Oil and Grease in that areas. Moreover, for the seasonal fishing at sea, the engine boats and other fishing boats contributes huge amount of oil and grease in the river water. .

### *Findings*

Passur River is highly influenced by tidal effects. Tidal penetration in the Passur River depends on seasonal change, upstream flow and catchment water discharge. However, the physico-chemical properties of Passur River changes with the tidal intrusion in different seasons.

During 31<sup>st</sup> quarterly monitoring, pH was found slightly basic in nature. Salinity, Temperature and Dissolved oxygen level was found in fair and favourable for the aquatic life forms. During the 30<sup>th</sup> quarter (post-monsoon, 2021), TDS and TH has been relatively same with respect to the same seasons of last consecutive years. Nitrate (NO<sub>3</sub><sup>-</sup>) level remained relatively lower. The phosphate (PO<sub>4</sub><sup>3-</sup>) was found within the safe limit of aquatic organisms. In case of metal pollution, no variation was recorded for As, Pb and Hg concentration and even no issues as well. Oil & grease concentration was found less than 2.0 mg/L at all sites which is less than the recommended concentration (10 mg/L) for Inland Surface Water.

### **2.3.6 Status of the Groundwater quality**

#### *In-situ tested parameters*

The in-situ tested results obtained up to 31<sup>st</sup> monitoring period (January, 2022: Winter season) are described below:

#### pH and Temperature

The values of pH and temperature of groundwater in the monitored sites complied with the drinking water quality standards as specified in ECR, 1997 (6.5-8.5 and 20-30°C respectively). The pH values during 31<sup>st</sup> monitoring scheme were found to vary from 7.7-8.1. When it comes to increasing drinking water alkalinity, various chemicals and pollutants are known to cause high pH levels. If the soil or bedrock around groundwater sources includes carbonate, bicarbonate, or hydroxide compounds, those materials get dissolved and travel with the water. These mineral deposits also increase the alkalinity of the water. On the other hand the temperature was recorded between 23°C -25°C. No significant differences have been observed against the previous seasons results. Temperature were found more or less consistent with the previously respective season's data. However, the 31<sup>st</sup> consecutive monitoring results of pH and temperatures (monsoon) of selected sites are presented in **Figure 2.24 and 2.25** the observed dataset of pH and Temperature are attached in **Table B.17 of Appendix- IV**.

#### Salinity and Dissolved Oxygen (DO)

Groundwater salinity concentration in all the monitoring sites were found to be increasing trend with respect to previous years during post-monsoon period except for groundwater salinity of power plant area. High ground water extraction, ground water salinity intrusion or surface saline water percolation may be

the key reason for increasing the level of salinity into ground water over the years for Rajnagar and Kapashdanga. (**Table B.18: Appendix- IV**).

DO values ranged between 3.5-6.2 mg/L during this monitoring season. DO concentrations were found to be slightly higher than the permissible limit of ECR, 1997 (6.0 mg/L) in power plant groundwater. A slight low DO concentration in drinking water might only reduce the taste of water. Higher DO level makes water tastier but causes corrosion to the supply pipe.

All monitoring results of salinity and DO of the selected monitoring sites are presented in **Figure 2.26 and 2.27** and all the observed dataset of DO and Salinity are attached in **Table B.18 of Appendix- IV** respectively.

#### *Laboratory tested parameters*

The laboratory tested results obtained up to 30<sup>th</sup> monitoring period (Oct, 2021: post-monsoon season) are described as follows:

##### TDS, TSS and TH

The highest TDS value of 860 mg/L was recorded in Kapashdanga tubewell, followed by Rajnagar (615 mg/L) and Project area (350 mg/L). Which complied completely with the ECR' 1997 (1,000 mg/L) (**Figure 2.28: TDS**). TSS also known as non-filterable residue, are the solids (minerals and organic material) which remain trapped on a 1.2µm filter (U.S.EPA, 1998). During the 30<sup>th</sup> monitoring period, the TSS concentrations was recorded around 1-4 mg/L, which complied within the Standard for Drinking Water, Bangladesh (TSS: 10mg/L, ECR, 1997) (**Figure 2.29: TSS**). TSS was found much higher than the drinking standard quality particularly at Rajnagar during the pre-monsoon in 2017 and 2018.

TH concentrations of the three monitored spots varied from 70mg/L to 243mg/L during the last post-monsoon period. The maximum value was found near Rajnagar followed by Kapashdanga and Township. Over the last eight post monsoon seasons monitoring, drinking water hardness complied with standard limit (200-500 mg/L) set by the ECR' 1997 most of the time.

Groundwater TDS, TSS and TH values of the consecutive winter periods are presented in **Figure: 2.28, 2.29 and 2.30** and all the observed dataset are attached in **Table B.19 and B.20 of Appendix- IV**.

##### Chemical Oxygen Demand

The Bangladesh standard for COD in drinking water is 4.0 mg/L. Monitoring sites completely breached with the Bangladesh Standard as COD concentrations for every site in the last monsoon period except in power plant groundwater as like the year 2014 and 2015. However, the highest value of COD was found at Project site drinking water (28.0 mg/L) Increasing organic or inorganic compounds or ion in the ground water was the major cause for increasing COD in the ground water during monsoon in the monitoring areas.

The COD concentrations of all the pre-monsoon period monitoring sites are given in **Figure 2.31** and all the observed dataset are attached in **Table B.21 of Appendix- IV**.

##### Nitrate, Sulphate and Phosphate

Natural nitrate levels in groundwater are generally very low (typically less than 10 mg/l  $\text{NO}_3^-$ ), but nitrate concentrations increase due to human activities, such as agriculture, industry, domestic effluents and emissions from combustion engines. The sources of nitrates pollution in groundwater are cultivation in areas where the soil layer is relatively thin, or has poor nutrient buffering capacity, or where there are changes in land use; over fertilization of crop for intensification of agricultural activity; spread cultivation of crops which require high fertilizes doses and which leave the soil bare over long periods (maize, tobacco and vegetables); drainage systems which lead to drainage of fertilizers; intensive agricultural rotation cycles involving frequent ploughing and extensive areas of bare soils during winters; organic fertilizers form animal husbandry and increased urbanization. Among the monitoring tiers, the  $\text{NO}_3^-$  values were

found to be highest during the monsoon of 2018 though it was found to be within the standard limit set by ECR'97. However, during last monsoon period, the nitrate values were found to be highest (4.1 mg/L) in Rajnagar and lowest in Kapashdanga (2.6 mg/L).

On the other hand, Sulphate ( $\text{SO}_4^{2-}$ ) have been complying with the Bangladesh Standard for Drinking Water Quality (400 mg/L) from the beginning of the monitoring study. During the last post monsoon, highest (6.2 mg/L) values was found in Rajnagar and lowest (2.2 mg/L) in Project area.

In addition, the concentrations of  $\text{PO}_4^{3-}$  were ranged between 0.6mg/L and 1.4mg/L, which was within the standard limit of 6.0mg/L (ECR'1997).  $\text{PO}_4^{3-}$  concentrations actually have both spatial and temporal variations but which is minor in the interest of this monitoring objectives as well as drinking purpose by the community resides there. The observed winter seasons  $\text{NO}_3^-$ ,  $\text{SO}_4^{2-}$  and  $\text{PO}_4^{3-}$  concentrations of groundwater are presented in **Figure 2.32, 2.33 and 2.34** and all the observed dataset are attached in **Table B.22, B.23, and B.24 of Appendix- IV**.

#### Arsenic (As), Lead (Pb) and Mercury (Hg)

According to Bangladesh Standard (ECR, 1997), the maximum acceptable concentration of Arsenic (As) in groundwater is 0.05 mg/L. The As concentrations among all the monitoring locations ranged between 0.06 mg/L and 0.003 mg/L. The As level of Rajnagar slightly exceeded the Bangladesh standard for drinking water quality (ECR, 1997) and in the next monitoring the owner of the tube-well will be informed about the As level exceedance (**Figure 2.35: Arsenic**).

Lead (Pb) and Mercury (Hg) concentrations were also measured and the values were found within the permissible limit specified in ECR 1997 (0.001 mg/L for Pb and less than 0.001 mg/L for Hg). The concentration of Pb showed only spatial variation to some extent in some seasons (**Figure 2.36: Lead**). However, the water of the tube-wells was found suitable for drinking purpose in terms of metal pollution status.

The observed values of as and Pb in all the winter seasons are presented in **Figure: 2.35 and 2.36** and all the observed dataset of As, Pb and Hg are presented in **Table B.25, B.26 and B.27 of Appendix-IV**.

#### *Remarks*

This concluding remark represent that the physical characteristics of groundwater quality is still in good condition with slight variation in pH and salinity. The reason being saline water intrusion and infiltration due to excessive withdrawn of groundwater by the surrounding communities during the dry season. In addition, evaporation also responsible for this slight salinity in groundwater. Project activities are not related to this sort of changes in salinity. Chemical characteristics of the groundwater quality are also found relatively good. The observed groundwater is completely free from the metal pollution particularly Lead and Mercury. But Arsenic pollution was recorded at Kapashdanga monitoring station during the last post monsoon. However, the other parameters were found to be well below the standard set by ECR'97.

## **2.4 Land Resources Monitoring**

### **2.4.1 Methodology**

Monitoring of selected indicators is very crucial for better management of land resources in the study area. Plot/land use, soil fertility/nutrient status, soil contamination with heavy metals and soil salinity have been considered as the major indicators for land resources monitoring. It is also assumed that during the operation phase of the power plant, fly ash and other air borne pollutants may get deposited on the surrounding agriculture land, which ultimately will pollute the study area soil. Before that (during pre-construction and construction stage), only natural phenomenon's are responsible to alter soil parameters.

### Sampling Frequency

The frequency of monitoring for land resources data collection has been considered twice in a year. Accordingly, the soil samples were collected during 30<sup>th</sup> monitoring field visit (November, 2020) and sent immediately to laboratory for analysis. The analysis data has been incorporated with this monitoring report.

### Monitoring Indicators

The continuous monitoring has given an opportunity to observe seasonal change along with spatial change of selected indicators of sampling plots. The selected indicators are soil reaction (pH), soil salinity (EC), Organic matter (OM), base cations-Ca, Mg, K and Na, status of macro nutrients (N, P and S), status of micro nutrients (B, Fe, Mn and Zn) and presence of heavy metals (Pb and Cd). Sodium absorption ratio (SAR), exchangeable sodium percentage (ESP) can be calculated from the analysed data. It may also be mentioned that the structural change of soils in the sampling plots can also be identified from these data.

The formula to calculate SAR is given below, with concentration expressed in milli equivalents per liter (meq/L) analysed from a saturated paste soil extract.

$$SAR = \frac{[Na^+]}{\sqrt{\frac{1}{2}([Ca^{2+}] + [Mg^{2+}])}}$$

ESP is the sodium adsorbed on soil particles as a percentage of the Cation Exchange Capacity (CEC). It is calculated as:

$$ESP = \frac{[Na]^+}{CEC} \times 100$$

CEC is often estimated as the major exchangeable cations, including hydrogen. Both cation and CEC are expressed as meq/100g. ESP can also be calculated as:

$$ESP = \frac{[Na]^+}{[Ca^{2+} + Mg^{2+} + Na^+ + K^+]}$$

ESP is used to characterise the sodicity of soils only, whereas SAR is applicable to both soil and soil solution or irrigation water.

### Location

The selected mauzas for monitoring are Baranpara (E-89°30'59.1", N-22°37'57.0") of Batiaghata Upazila, Chunkuri-2 (E-89°32'20.0", N-22°34'51.0") of Dacope Upazila, Kapalirmet (E-89°36'8.8", N-22°32'18.9") of Mongla Upazila, Chakgona (E-89°34'25.3", N-22°34'18.3") of Rampal Upazila and Basherhula (E-89°34'25.0", N-22°36'14.0") of Rampal Upazila under Khulna and Bagerhat Districts. However, a new sampling location (Bidyarbon- E-89°34'40.0", N-22°33'42.0") of Mongla Upazila was included with the previous ones for monitoring as per ToR. The sampling locations with their corresponding coordinates are stated in **Table 2.9**. Locations of collected soil samples are presented in **Figure 2.37**.

**Table 2.9: Land Resources Monitoring Plan**

Site No.	Monitoring indicators	Location	GPS(Decimal Degree)		Sampling Frequency	Methods/Tools/ Techniques

#### 2.4.2 Process of Soil Samples Collection

##### *Plot Selection*

Monitoring plots were selected at the very beginning of this study. Expert's judgement along with plot owner's opinion was taken into consideration for this selection. Upazila Agriculture Officers of Batiaghata and Dacope of Khulna District, Rampal and Mongla of Bagerhat District and Senior Scientific Officer of Soil Resource Development Institute (SRDI) of Khulna were contacted for collecting expert's judgement. Wind speed and wind direction were considered as potential local factor for the monitoring purpose. All the selected plots were characterized as medium high land ( $F_1$ ), which are normally flooded in the range of 30-90 cm and remain inundated for more than two weeks to few months during the flood period.

##### *Soil sample collection*

Standard procedure was maintained during the collection of soil samples. In every plot, minimum three pits were dug through augur to collect composite sample. Each plot had three composite samples, top soil (0-15 cm), sub soil (15-30 cm) and sub stratum (30-45 cm). Soil samples were preserved in an air-tight plastic bag for laboratory analysis.

##### *Laboratory Analysis*

Collected soil samples were handed over to the SRDI, Dhaka for laboratory analysis. The analysis data and report have been incorporated with this monitoring report.

### **2.4.3 Status of soil quality monitoring plots**

Soil quality (wet season) of the monitoring plots are given below.

#### *Monitoring Plot-1 (Baranpara)*

Top soil organic matter concentration has dropped drastically after two consecutive year rise. Total nitrogen concentration follows the similar trend. This might be an impact of top soil erosion or over deposition of salt. Phosphorus concentration increased than the previous year while Sulphur concentration decreased.

pH and salinity have increased in the monitoring plot. Although EC reduced than previous year but SAR and ESP increased. This might be a cause of increase of single valent cations (Sodium). Among the divalent cations, Calcium concentration remained similar while Magnesium concentration almost dropped to a year back position after last year climb.

Among the micro nutrient's concentration, iron and manganese concentration increased while Boron and Zn concentration decreased which might be an impact of salinity increase of that area. Lead and Cadmium concentration have also increased than the previous year but still are below the permissible limit (Pb-85 ppm and Cd-08 ppm).

#### *Monitoring Plot-2 (Chunkuri-2)*

Organic matter, Nitrogen and Sulfur concentration decreased, but Phosphorus concentration has increased which might be due to the impact of erosion and increasing salinity. Although EC has decreased, but SAR and ESP value increased where base mono valent cations (K, Na) have increased but divalent cations show decreasing pattern. pH is almost similar to last year. All micro nutrients concentration has decreased except iron concentration. Pb and Cd concentration also increased but stay within the permissible limit.

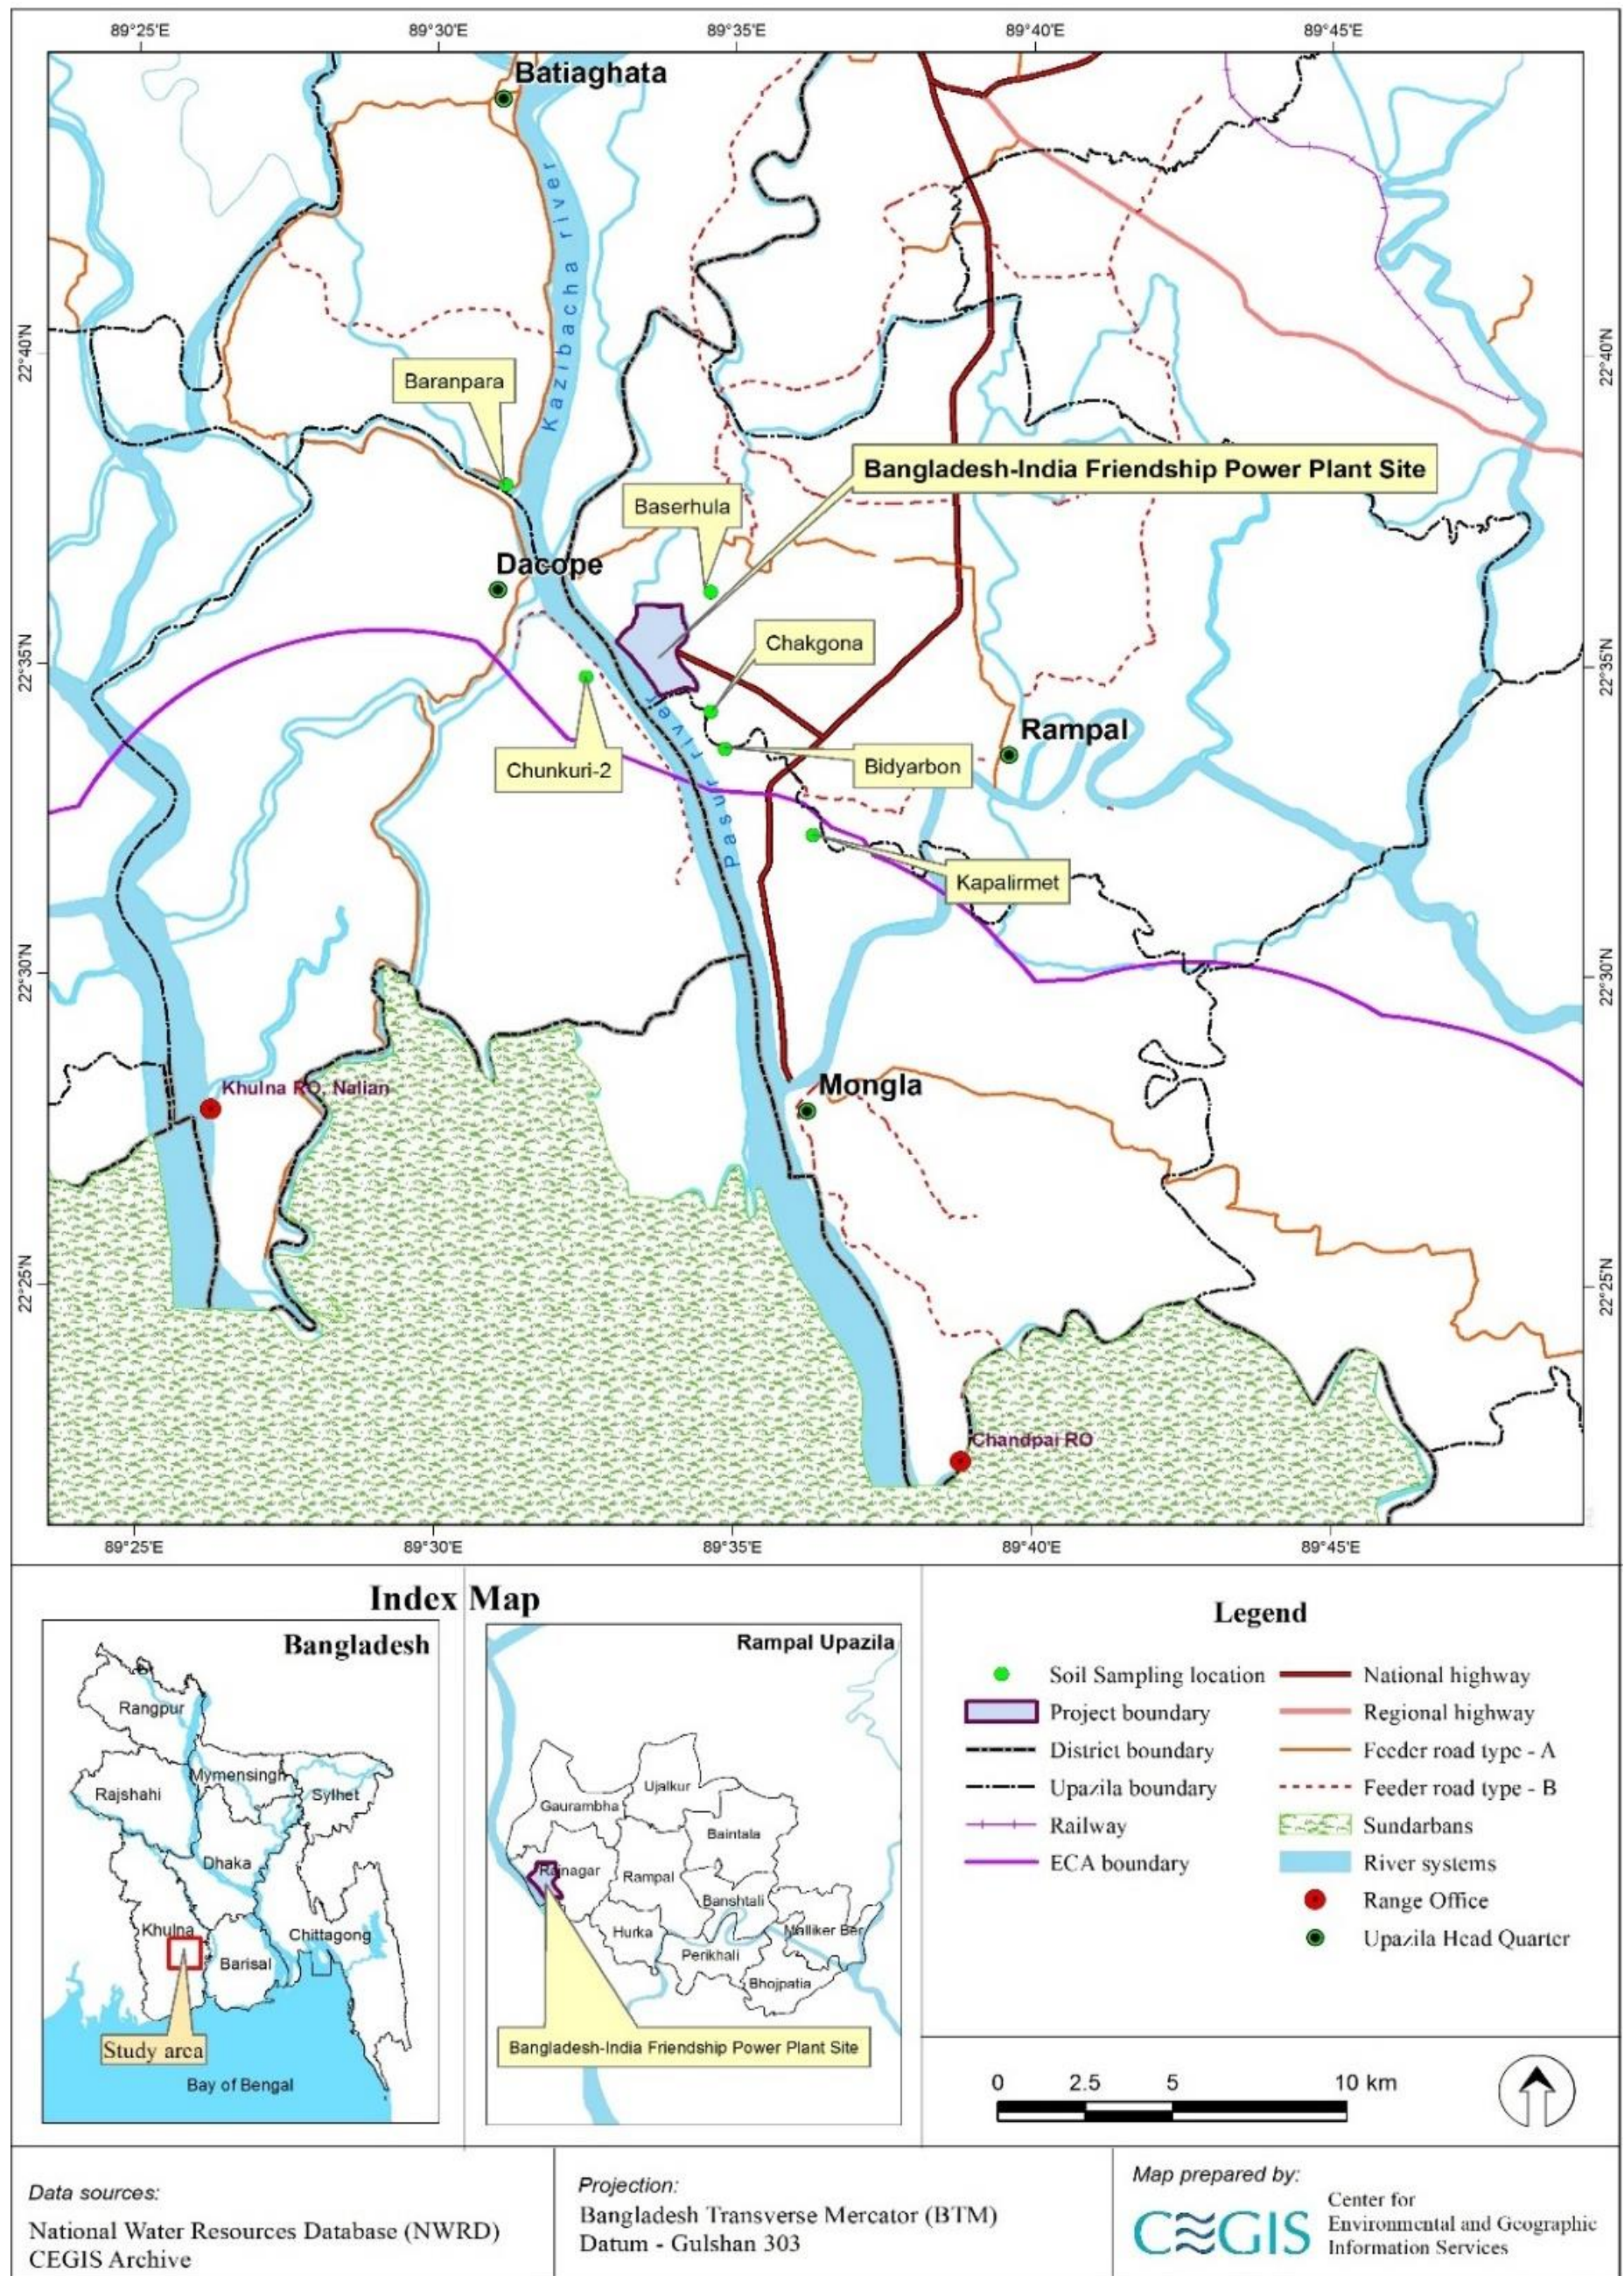

Figure 2.37: Land and Agricultural Resource Monitoring Locations

#### *Monitoring Plot-3 (Kapalirmet)*

This monitoring plot was used for fish cultivation during pre-monsoon and post monsoon period. During monsoon period this area completely goes under water. Decreasing salinity was a common scenario of this monitoring plot due to leaching and continues lentic ecosystem. But salinity has increased for two consecutive years. This might be an after impact of regular tidal water allowance in the plot for fish cultivation. Among the base cations Sodium, Potassium and Calcium showed increasing trend while Magnesium showed decreasing trend. Due to submerged condition, organic matter of this area increased. Another essential element concentration followed the similar trend. Manganese and Zinc concentration has decreased in the micro elements while Iron and Boron concentration increased. Pb and Cd concentration has also increased in this monitoring plot.

#### *Monitoring Plot-4 (Chakgona)*

Organic matter has decreased, so is Nitrogen and Sulphur. But Phosphorus concentration has increased which is an indication of soil degradation and erosion of top soil of that area during rainy season. Overall salinity of this area has increased. EC, SAR and ESP also show the similar pattern. All base cations (K, Na Ca) showed similar trend except Mg. This might be an after effect of tropical cyclone. pH is almost similar to the previous year.

Increasing trend of Fe, Mn and B concentration has been observed in the monitoring plot while Zn concentration reduced. Pb and Cd concentration has also increased in this monitoring plot.

#### *Monitoring Plot-5 (Basherhula)*

One part of this monitoring plot is exposed to river. So, there is a good possibility of quick wash out and soil erosion during monsoon period. This scenario also indicates vulnerability to storm surge and salinity intrusion from riverside during extreme events. Organic matter concentration remained similar to the previous year wet season monitoring, but nitrogen concentration is slightly reduced. Phosphorus and Sulphur concentration also decreased which might be an impact of top soil erosion or increased salinity.

pH and salinity of the monitoring plot is increasing than the previous monitoring year. All salinity related parameters (EC, SAR and ESP) follow the similar trend. This might be a cause of increased monovalent cations (Sodium and potassium) and reduced divalent cations (Ca and Mg). All micro nutrients concentration has increased except Zinc. Concentration of heavy metals also increased than the previous wet season monitoring year but still remains within the limit.

#### *Monitoring Plot-6 (Bidyarbon)*

Organic matter and Nitrogen concentration increased but Sulfur and Phosphorus concentration has decreased which might be due to the impact of erosion and increasing salinity. Although EC has decreased but SAR and ESP value increased where base mono valent cations (K, Na) have increased but divalent cations shows decreasing pattern. pH is almost similar to last year.

Fe and Mn concentration has increased during this monitoring period while Zn and B concentration has decreased. Increasing salinity might reduce the presence of these two elements. Lead and Cadmium concentration have increased than the previous year, but still stayed below the permissible limit.

**Figure 2.54: Changes of Lead (ppm) in wet seasons in sampling locations throughout the monitoring period**

#### 2.4.4 Agricultural resources monitoring

Monitoring of agriculture resources has been scheduled twice (April and October) a year as per the monitoring plan of the ToR. Next survey will be conducted in April, 2022 and report will be incorporated accordingly.

#### 2.4.5 Livestock resources monitoring

The frequency of monitoring for livestock resources data collection has been considered twice in a year (April and October). Next survey will be conducted in April, 2022 and report will be incorporated accordingly.

### 2.5 Transportation Monitoring

#### 2.5.1 Location of Traffic Survey

The traffic survey for this monitoring during the construction phase was conducted from January 29<sup>th</sup> to January 31<sup>st</sup>, 2022 on two weekdays and one weekend at three pre-selected locations around the project site. Weather was sunny on all the three days when the survey was conducted.

The selected sites were Khudir Bottola and Gonai Bridge at Khulna Mongla Road and Gonabelai Bridge at Power Plant access road presented in the **Figure 2.55**.

#### 2.5.2 Methodology

Traffic surveys were carried out at three distinct periods (morning - 7:00 AM to 10:00AM; noon-12:00 PM to 2:00PM and evening- 17:00 PM to 19:00PM) to understand the nature of traffic flow and traffic load on the preselected locations during different phase of the day. Vehicles were categorized based on the available vehicle types around the project area.

#### 2.5.3 Traffic Volume Calculation

The survey results were used in computing the traffic volume of these roads in Passenger Car Unit (PCU). PCU is a matrix used in Transportation Engineering, to assess traffic-flow rate on roadways. A PCU is essentially the impact that a mode of transport has on traffic variables (such as headway, speed, density) compared to a single car. While calculating the traffic volume in PCU, vehicle conversion factors suggested by the Roads and Highway department of Bangladesh were used as mentioned in **Table 2.10**.

**Table 2.10: Vehicle Conversion Factors**

Vehicle type	Factor
Bus	2.5
Minibus/Truck	2
Car/Microbus/Zeep	1
CNG	0.5
Rickshaw/Auto Rickshaw	0.8
Tempo/Human hauler	0.6
Motorcycle	0.3
Bicycle	0.2
Push Chart	4

#### 2.5.4 Results of Monitoring

The summary results of vehicular movements at three different locations presented in **Table 2.11** shows that, according to the Passenger Car Unit (PCU) per hour, the Khulna-Mongla Highway receives the largest number of vehicles, compared to other surveyed roads.

**Table 2.11: Calculated PCU in Three Locations at Three Different Time Period**

Location	7:00 AM to 10:00AM	12:00 PM to 2:00PM	17:00 PM to 19:00PM
Khulna Mongla Road at Khudir Bottola	666	951	506
Khulna Mongla Road at Gonai Bridge	277	452	427
Power Plant access road at Gonabelai Bridge	145	118	148

Source: Field Survey, January, 2022.

Similar to the earlier months monitoring report, vehicular movements were observed during the surveys were mostly for the regular construction activities of the Power Plant as the construction activities of the Power Plant are progressing heavily. Khulna Mongla Road at Khudir Bottola received the highest traffic volume compared to the other two locations namely Khulna Mongla Road at Gonai Bridge and Powerplant access road at Gonabelai Bridge. It is to be mentioned here that, during the morning time traffic volume at Khudir Bottola and Khulna Mongla Road at Gonai Bridge were found to be lower whereas Power Plant access road at Gonabelai Bridge received higher traffic volume compared to the previous monitoring period. The detail survey findings regarding the traffic volume surveys as well as the detail calculations are attached in **Table E1, E2 and E3 of Appendix-IV**.

## 2.6 Water resources monitoring

### 2.6.1 Introduction

Bangladesh is a riverine country. Rivers in different hydrological regions have different characteristics. Rivers in the northern part have fluvial characteristics while it is tidal in the south. The Passur River is one of the dynamic and major rivers in the southern part of Bangladesh. The Rampal power plant is being constructed along the left bank of the Passur River (**Figure 1**). It is always important to monitor the morphological characteristics of the river at regular intervals to assess the dynamics of the river in case of any development works. Monitoring of river dynamics like erosion, accretion and shifting of the bankline of the Passur River on a half-yearly basis may facilitate the proper planning and management of the development work.

### 2.6.2 Methods to Assess the Riverbank Erosion and Accretion of the Passur River

For the assessment of the riverbank erosion and accretion, time-series satellite images were used. Then images were processed and analyzed before the assessment and identified the locations of erosion and accretion as well as the shifting of bankline. The steps of image processing and analysis is briefly explained below.

#### *Collection and Processing of Images*

Sentinel-1 Radarsat satellite images having 10m resolution covering the Passur River from Chalna to Hiron Point for the period from September 2021 to March 2022 were collected. After that, satellite images were geo-referenced to have the same projection system. Then, it was found that one image differs from another image. Under these circumstances, images were co-registered to avoid distortion with each image.

#### *Delineation of Banklines*

After the collection and processing of images, banklines were delineated for the mentioned period using the Arc-GIS tool. Then, banklines were analyzed and superimposed to assess the erosion-accretion and shifting of the river during the period from September 2021 to March 2022.

#### *Monitoring of Erosion & Accretion and Shifting of the Banklines*

For monitoring the erosion and accretion at the project site, Mongla, Harbaria and Akram point areas, banklines of the Passur River were superimposed with each other.

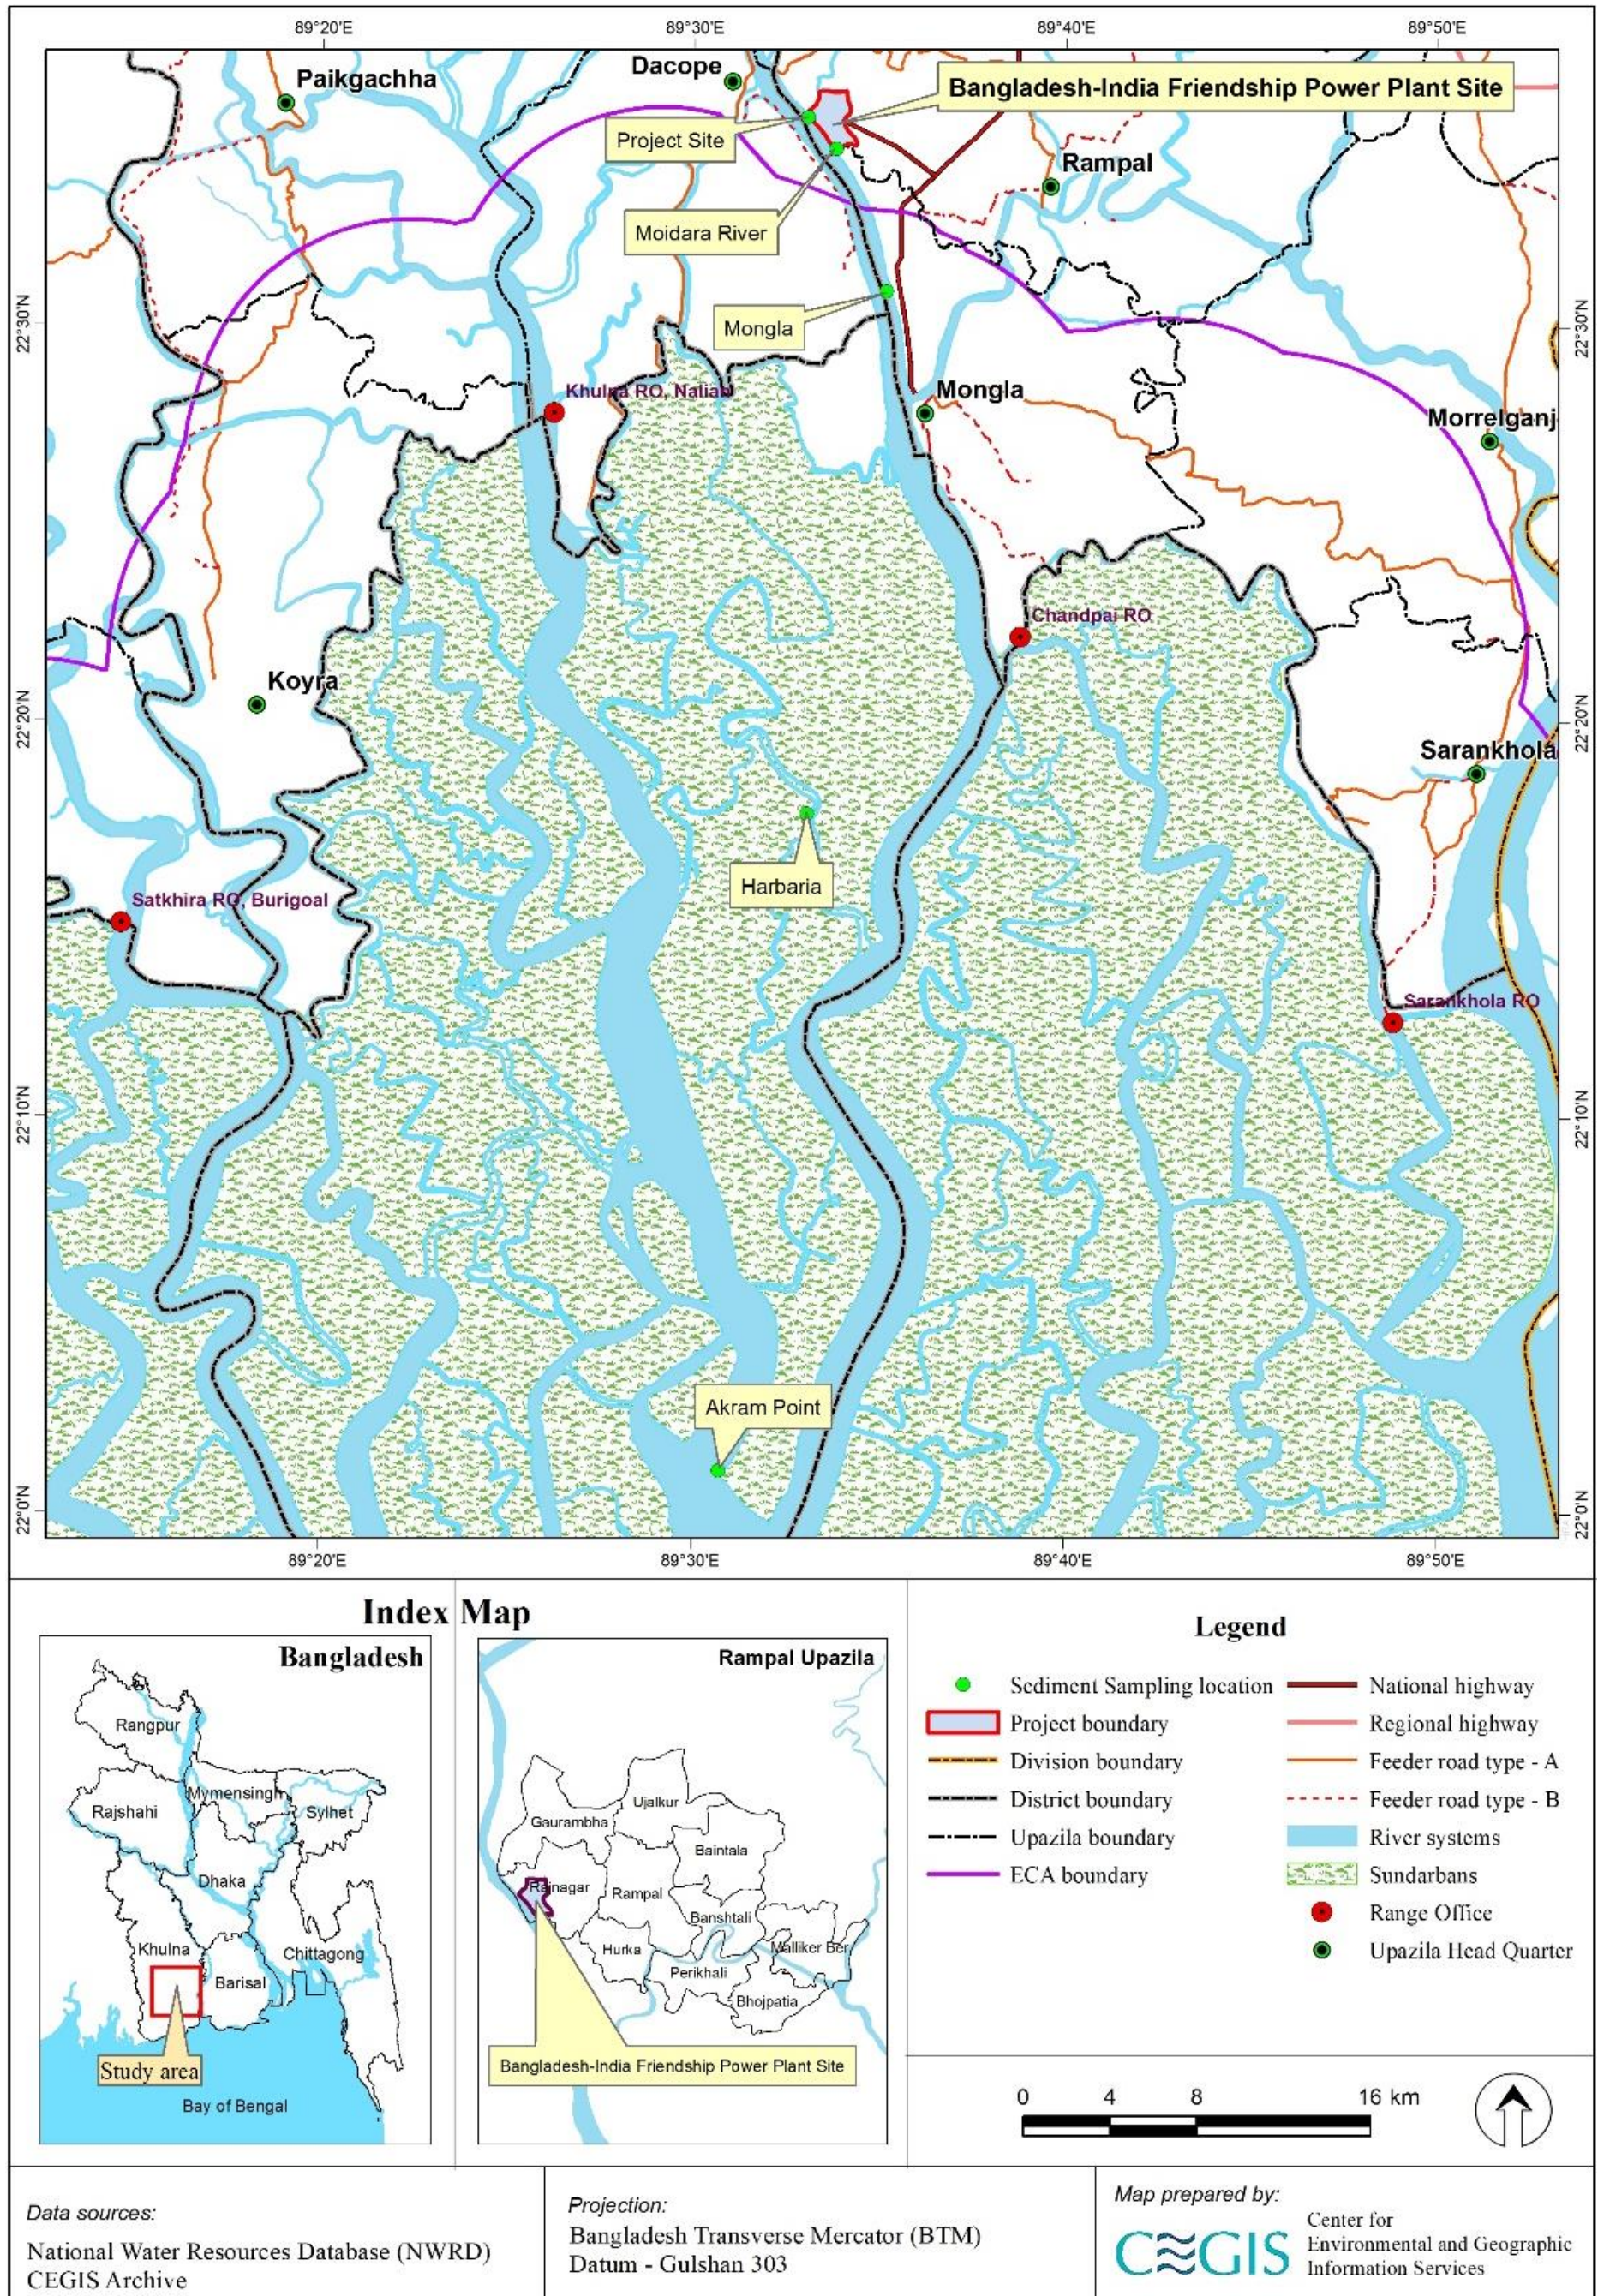

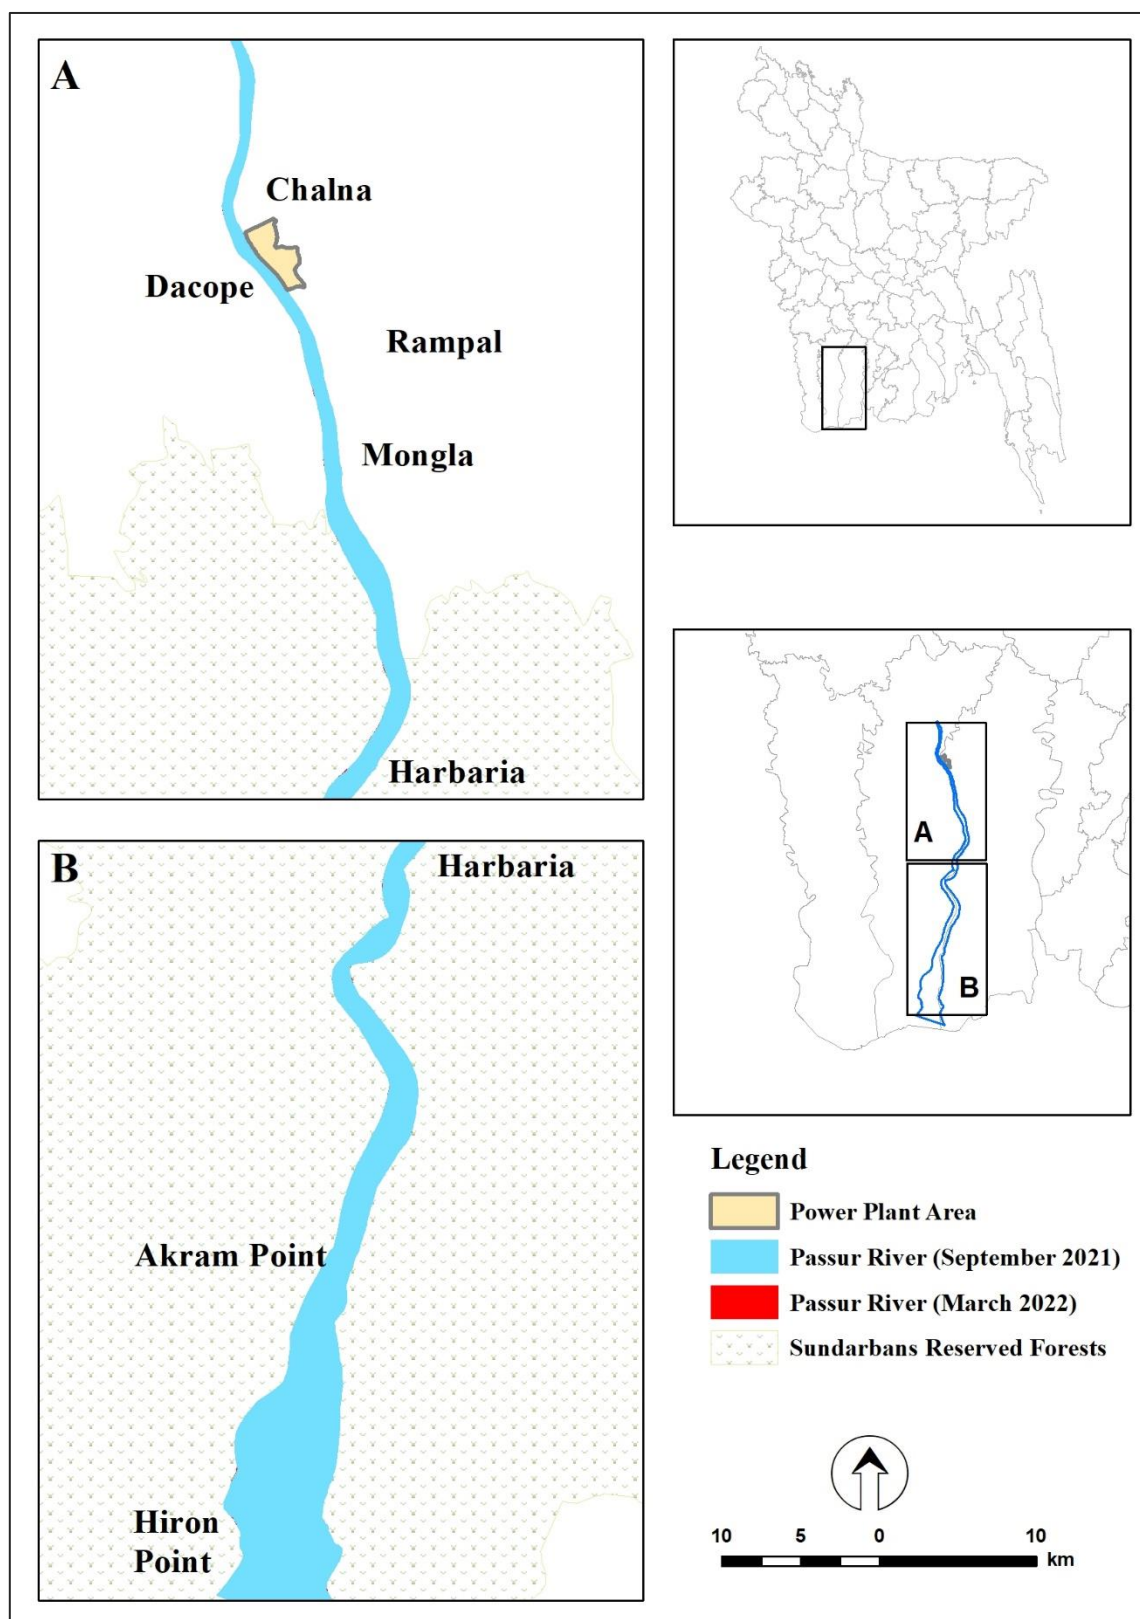

Figure 2.55: Locations of Traffic Survey

It was found that the river is stable and there is no riverbank erosion or accretion as the river has not shifted from September 2021 to March 2022 (**Figure 2.56**) although there is red color (represents erosion) in a few locations along its both banks during its passage from Chalna to Hiron Point which may be considered as insignificant.

**Figure 2.56: Riverbank erosion and accretion of the Passur River from September 2021 to March 2022**

### 2.6.3 Tidal Water Level Data Analysis

For the monitoring of the tidal water level of the Hiron Point, Mongla Port and Rampal Jetty area, daily tidal water level data at Hiron Point and Mongla Port were collected from Bangladesh Inland Transport Authority (BIWTA) for the period from July 2021 to December 2021. Based on the relationship of the water level between Mongla Port and Hiron Point, the lag time and peak attenuation from Mongla Port to Rampal Jetty area were extrapolated.

### 2.6.4 Relation between Hiron Point and Mongla Port

For the assessment of lag time and peak attenuation between Hiron Point and Mongla Port, daily peak tidal water levels were taken into consideration for the period from July 2021 to December 2021. After that, peak tidal water level data were plotted in the same graph both for Hiron Point and Mongla Port which is presented in **Figure 2.57**.

**Figure 2.57: Peak water level at Hiron Point and Mongla Port for the period from July 2021 to December 2021**

Moreover, maximum water level and corresponding time during full moon and no-moon were assessed to find out the lag time and peak attenuation between two stations (Mongla and Hiron Point) considering the distance between stations.

For the assessment of the lag time and peak attenuation between two stations for two different quarters in the second half of the year 2021, tidal water level data from July to September 2021 as well as October to December 2021 were analyzed respectively.

It was found that during the no-moon period, a peak water level of 3.35 m in July 2021 at Hiron Point travels through the tide to the upstream at Mongla Port where its peak water level is 4.60 m on the same day (**Figure 2.58**). The peak attenuation between these two stations is 1.25 m during the no-moon period in July 2021. It was also found that the travelling time or lag time to reach this peak is around 2 hours 0 minutes. Additionally, peak attenuation for August and September 2021 are 1.01 and 1.24 respectively. While the lag time is having same at 1 hour 0 minutes correspondingly for August and September 2021 (**Figure 2.58**). The methodology is shown in **Figure 2.58**. It was also measured that the distance between Hiron Point and Mongla Port is approximately 80 km. The average travelling time to pass the peak water level through tide from Hiron Point to Mongla Port during the period from July to September 2021 is about 1 hour 20 minutes while the peak attenuation is nearly 1.17 m.

Furthermore, an analysis was done from October to December 2021 (**Figure 2.59**). It was found that the peak attenuation for October and November are 1.34 and 1.27 respectively while it is 1.26 for December 2021.

**Figure 2.58: Process of calculation of lag time & peak attenuation during the period July-September 2021**

On the other hand, the lag time to reach peak water level from Hiron Point to Mongla Port for October, November and December is the same which is 1 hour 0 minutes (**Figure 2.59**). In addition to that, the average travelling time to pass the peak water level through tide from Hiron Point to Mongla Port during the period from October to December 2021 is about 1 hour 0 minutes while the peak attenuation is nearly 1.29 m.

**Figure 2.59: Peak water level at Hiron Point and Mongla Port for the period from October 2021 to December 2021**

In summary, it was found that the average travelling time to pass the peak water level through tide from Hiron Point to Mongla Port during the period from July to December 2021 is about 1 hour 10 minutes while the peak attenuation is nearly 1.23 m.

Relation between Hiron Point and Mongla Port was used to extrapolate the lag time and peak attenuation at the Rampal Jetty area. The travelling distance from Mongla Port to the Rampal Jetty area is 15 km. Based on the relation, it was estimated water level at a certain peak at Hiron Point needs 1 hour and 24 minutes to reach the Rampal Jetty area where peak attenuation is nearly 1.46 m

### 2.6.5 Monitoring of Chemical properties of riverbed sediment

Sediment have been considered as an important environmental indicator for metal pollution in any natural ecosystem. The investigation of heavy metals in water and sediments could be used to assess the anthropogenic impacts and risks posed by waste discharges to the riverine ecosystems. Therefore, sediment quality assessment is done during environmental issues monitoring of this project.

### 2.6.6 Methodology

#### *Sampling frequency*

The frequency of monitoring for sediment quality is considered twice in a year (January and July). Accordingly, sediment sampling was done in 31<sup>st</sup> monitoring (January, 2022; considered as dry season). Data analysis of that sampling is incorporated in this report.

#### *Monitoring indicators*

The main objective of sediment quality monitoring is to find out the heavy metal accumulation in sediments due to anthropogenic activities (e.g. power plant activity and coal transportation). To find out the answers a biannual sediment monitoring is done in different sampling points. The major indicators for monitoring are heavy metals (As, Pb and Hg), pH and Sulfate. The selected heavy metals are mainly found in coal and assumed to pollute the sediment and water system during operation stage of power plant.

#### *Location*

The sampling locations are selected in both near places of project area and inside the Sundarbans. The sampling locations are stated in **Table 2.12**. Locations of collected samples are presented in **Figure 2.60**.

**Table 2.12: Location of Sediment Monitoring Plan**

Site No	Monitoring Indicators	Location	GPS (Decimal Degree)		Sampling Frequency	Methods/Tools/Techniques
			Northing	Easting		
1	Heavy metals (Arsenic-As, Mercury-Hg, Lead-Pb); pH and Sulfate (SO <sub>4</sub> )	Project Site	N-22°35'21.2"	E-89°32'53.4"	Bi-yearly (January and July)	In situ field sampling and Laboratory Testing at BCSIR
2		Moidara River	N-22°34'33.4"	E-89°33'38.8"		
3		Mongla Port	N-22°30'57.1"	E-89°35'0.3"		
4		Harbaria	N-22°17'44.2"	E-89°32'53.4"		
5		Akram Point	N-22°01'07.6"	E-89°30'34.4"		

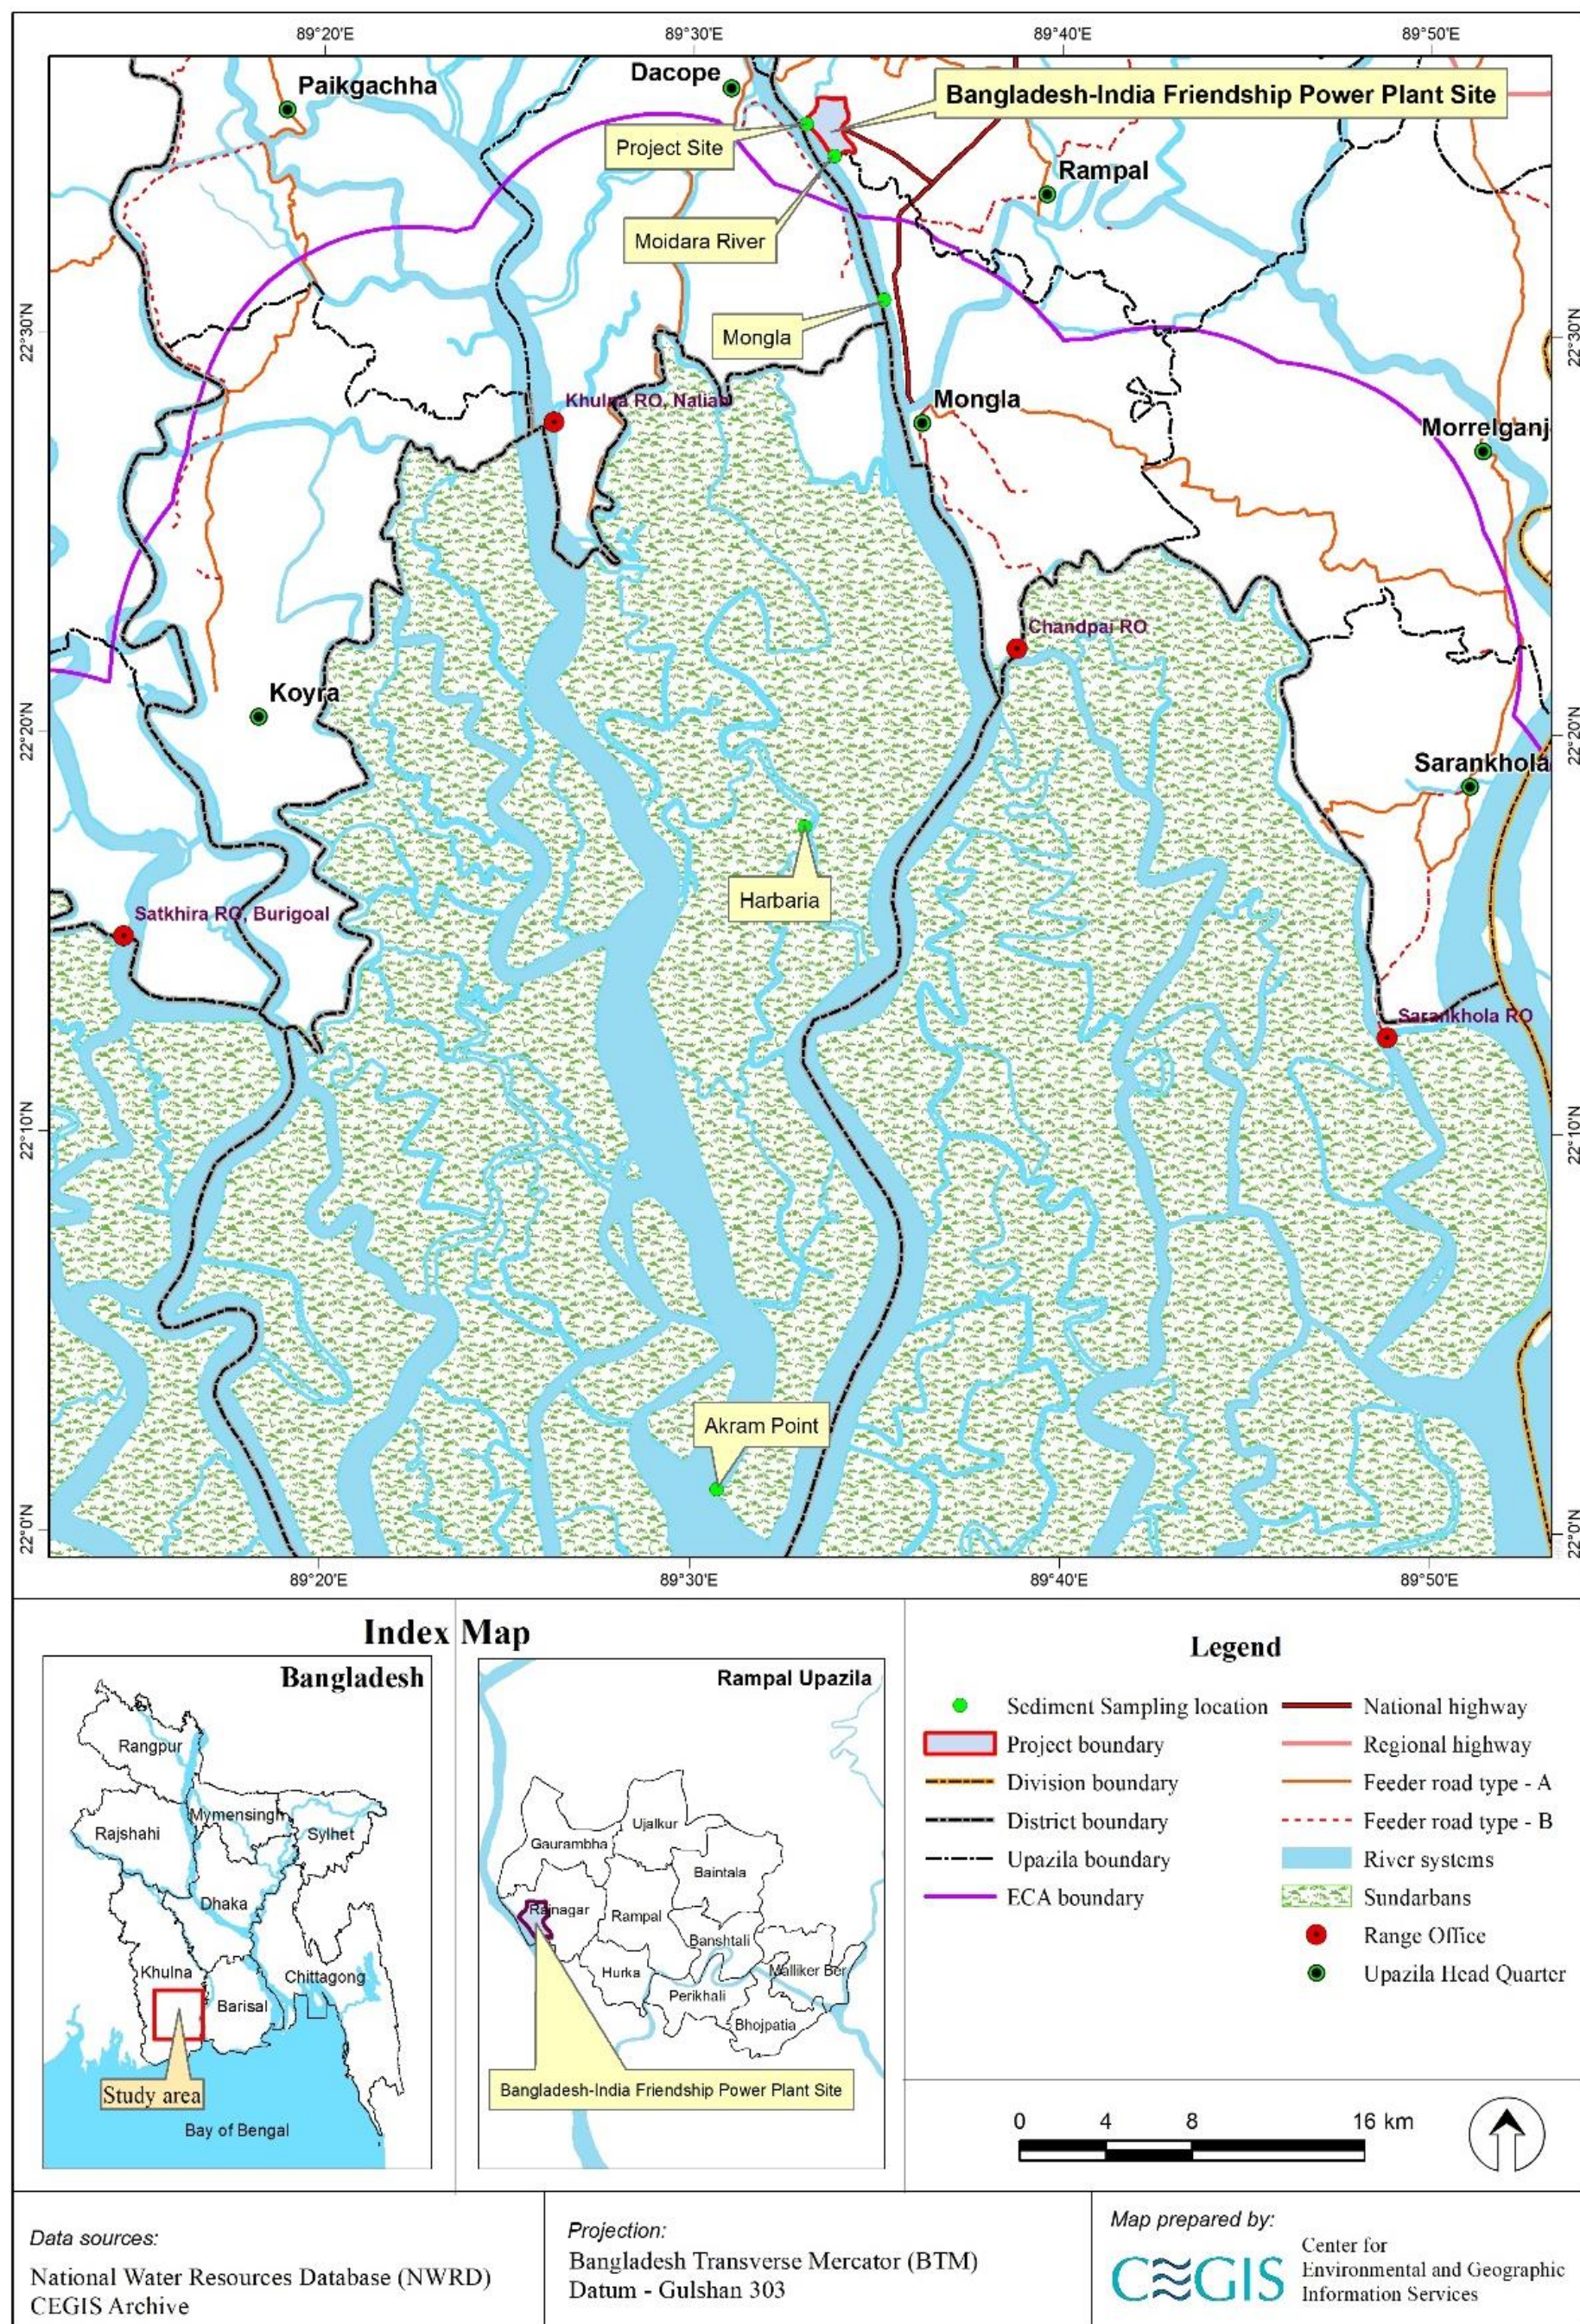

Figure 2.60: Locations of Sediment Sampling

### 3. Biological Environment

Biological resources include all living organisms within an ecosystem which interact with one another as well as with the concerned physical environment. The biological resources around the project site were categorized into three major groups and monitored quarterly with the aim to establish baseline conditions to compare with the probable impact of proposed project in place. These groups include fisheries resources, ecological resources and Sundarbans Reserve Forest (SRF).

#### 3.1 Fisheries Resources

The monitoring of twenty-nine quarters for the session of 2014-15, 2015-16, 2016-17, 2017-18, 2018-2019, 2019-20 as well as of 2020-21 was completed and reported earlier. This chapter contains the findings of 31<sup>th</sup> quarter and comparison with the earlier 30 quarters.

##### 3.1.1 Methodology

###### *Location of Monitoring Sites*

In this phase, the monitoring activities were carried out in 13 pre-selected locations of which 10 locations were for capture fish habitat and three (03) were for shrimp/fish farms (culture fish habitat). Sampling sites for capture fishery were selected based on the available fishing grounds at upstream, midstream and downstream of the Passur River system. Sampling sites for culture fishery (shrimp/fish farms) were selected considering the project influence area. The fisheries resources monitoring locations are provided in **Table 3.1** and also shown in **Figure 3.1**.

**Table 3.1: The Sampling Locations for Monitoring of Fisheries Resources**

Site	Capture Habitat Location	Site	Capture Habitat Location
A	Akram Point	F	Chandpai
B	Haldikhali	G	Jongra
C	Charaputia	H	Mongla Port
D	Bhodra	I	Maidara
E	Harbaria	J	Chalna Point, Batiaghata
Site	Culture Habitat Location	Site	Culture Habitat Location
1	Bhekatkhali Khal, Rajnagar	3	Chunkuri-2
2	Kapasdanga-Muralia		

###### *Selection of Parameters*

According to ToR, five major components were selected for fisheries monitoring, such as fish habitat status, fish migration, fish diversity, shrimp/fish farm practices and fish production. Fish habitat status was monitored through investigating habitat suitability index in view of habitat classification based on length frequencies of different fish species, sensitivity of fish diversity and survival success of different life stages of fish to abiotic factors (water quality, bed material, morphological aspects and biotic factors (food cover). Fish migration status was monitored through assessing migratory fish species diversity, migration pattern, migration purpose, period and extent of migration etc. Species evenness, species richness and community structure were investigated for monitoring fish diversity. Shrimp/fish farm practice was monitored by viewing stocking pattern, growth rate and mortality rate. Fish production monitoring was divided into capture and shrimp/fish farm production.

### *Fish Habitat Status*

Fish habitat status was monitored through determination of Habitat Suitability Index (HSI) by applying numerical habitat model based on the habitat classification and sensitivity of fish diversity and survival success of different life stages of fish to abiotic and biotic factors. Fish habitat classification was analyzed by calculating Euclidean Distance among sampling sites. Moreover, the similarities in species composition among the sites were analyzed using the Jaccard Index (JI) for estimating the extent of similarity between pairs of data sets.

### *Fish Migration*

Migratory species were identified from the sampling sites by analyzing the common species found in the catch assessment survey and based on IUCN list.

### *Fish Diversity*

Fish diversity was surveyed by Catch Per Unit Effort (CPUE) method. The fish individuals were counted according to the length of each species from the samples. Diversity was estimated by analyzing Shannon-Weiner Index ranges from 0 to 1. Fish species richness (FSR) was analyzed using the Simpson's Index that generates two types of values. The first one includes values from 0 to 1 expressing normalization scores for species richness status and the second one includes values from one (01) to values equal to the total number of species found in the sample which suggests that how many species are dominant in this fish community. Fish community structure has also been analyzed through counting the length-wise fish individuals.

### *Fish-Shrimp Culture Practice*

For monitoring shrimp/fish farm, three farms within the direct impact zone of the proposed Power Plant were surveyed. Stocking pattern of the shrimp/fish farm is the major issue for successful production, because of having natural genetic resources from the wild source of the Passur River System. Moreover, mortality rate should be minimized for getting more economical output from the farms. So, stocking pattern and mortality rate and its causes were surveyed intensively.

### *Fish Production*

Fish production for riverine fish was surveyed through CPUE. The information on the species-wise production of shrimp/fish farm was collected from the selected farms for the last catch.

### **3.1.2 Status of Monitoring**

Followed by the quarter monitoring of the 2014-15, 2015-16, 2016-17, 2017-18, 2018-19, 2019-20 and 2020-21 (up to 30<sup>th</sup> quarter monitoring), 31<sup>th</sup> quarter monitoring of session 2021-22 was conducted during the period from 28 January -08 February, 2022. No fishing activities were observed at Bhodra Khal (D), Jongra (G) and Chalna Point (J) during field visit in this quarter monitoring.

### *Fish Habitat Status*

Fish habitat status has also varied in the view of habitat classification and habitat use pattern of different life stages of different fish species.

### Habitat Classification

Habitat classification was analyzed by using the length-wise distribution of different fish species in the sampling sites. The length of different life stages of fish species was identified and evaluated from literature review. Linkage distance was calculated with the similarity in distribution. The entire stretch of the Passur River System consists of three major behavioral habitats. The sampling sites were classified on the basis of abundance of different life stages of fish species in those habitats. The following tables show the

Figure 3.1: Fisheries Resources Monitoring Locations

classification of seven (07) sampling site for 1 to 15<sup>th</sup> quarter monitoring and ten (10) sampling sites from 16<sup>th</sup> to 30<sup>th</sup> quarter monitoring according to the ToR in respect of habitat uses for previous quarters of fisheries monitoring (**Table 3.2**).

**Table 3.2: Classification of habitat use of 10 sampling sites**

During the 31<sup>th</sup> quarterly monitoring conducted in February of 2021-22 Session, the sampling sites were divided into two major classes and shown in the **Figure-3.2 (Figure D.1 of Appendix IV)**.

**1. Nursery Ground:** The Mongla (H) and Chandpai Point (F) were found to support mostly length groups of <2cn, 2-3cm of available fish species. Field findings revealed that the mentioned sampling sites were found to be used as nusesery ground of observed fish species.

**2. Maturation and feeding ground:** The sampling site, Akram Point (A) and Haldikhali (B) observed of dominant length group of 5-10cm and 10-20cm indicates that the sites function as the maturation of different fish species. The sampling sites, Charaputia (C) and Harbaria Point (E) were found to be rich in all length-groups except brood fish. Presence of dominant length groups of 5-10cm and 10-20cm indicate that the sites function as the maturation and feeding ground of different fish species (following the considerations of Rahman, 1989 and 2005; Huda et al., 2003).

### 31<sup>st</sup> Monitoring (January, 2022)

(Note: Life stages are identified through length measurement of the fish individuals)

**Figure 3.2: Habitat classification on the basis of different life stages of fish species**

The dendrogram indicated the distances among the JI (Jaccard Coefficient Index) indices which are opposite to the JI values. It was found that the length-wise distribution relationship varied not only with the seasons but also with the year to year. In this quarterly monitoring in 2021-22 (31<sup>st</sup>), the JI value between the Mongla Point (H) and Maidara (I) sampling sites were the highest (**Figure 3.3 and Table D.2 of Appendix IV**) which indicates the maximum similarity in species occurrence between the two sites out of 7 sampling sites of available fishing.

### 31<sup>st</sup> Monitoring (January, 2022)

**Figure 3.3: Dendrogram showing similarity in binary species composition in three sampling sites**

## Fish Diversity

Fish Species Richness (FSR)

Fish species richness was identified through Simpson's Index. Considerable difference is noticed in the fish species richness (FSR) in different habitat classes (**Table 3.3 & 3.4** and **Figure 3.5**). Species richness varies with the sampling sites. Maximum FSR was obtained at Charaputia (n=33), while very low FSR was recorded at Maidara and Mongla Point (n=11). Different scenarios of richness were found in this quarter in comparison to the previous monitoring years. Among habitats in the downstream of the Passur River system, Akram Poin was home to rich assemblage of *Chaka Chingri*, *Tiger Chingri*, *Datina*, *Paissa* and *Poa*, Haldakhali was of *Motka Chingri*, *Chaka Chingri*, *Tiger Chingri* and *Paissa*, Charaputia was of *Motka Chingri*, *Golda Chingri*, *Harina Chingri* and *Nandi Bele*, Harbaria Point was of *Chamua Chingri*, *Harina Chingri* and *Chaka Chingri*. In the midstream portion, Chandpai was rich of *Chamua Chingri*, *Bagda PL* and *Bele*, and Mongla was rich of *Chali Chingri*, *Bele* and *Paissa*. Available observed fish species at different locations are shown in **Figure 3.4**

Shannon-Weiner Index

In this monitoring year of 2021-22, species evenness also varies among the sampling sites. Highest Shannon-Weiner index was found at Harbaria Point (0.71) indicating most evenly distributed fish species. On the contrary, lowest evenness was found at Mongla Point (0.06) (shown in **Table 3.5**). It has also been found that both the number of fish species found in in-situ catch and the evenness of their distribution within the sampling sites show high variation with the changing seasonal and yearly bio-physical conditions.

(FSR is identified through Simpson's Index)

**Figure 3.5: Site-wise fish species richness (FSR) in the Passur River System**

#### Fish Community Structure

Fish community structure was analyzed through counting the length-wise fish individuals (**Figure 3.6**). **Table D.3** of **Appendix IV** and **Figure 3.6** for 31<sup>st</sup> quarter of monitoring shows that Fry were dominant at Chandpai, Mongla and Maidara Point, Juvenile were dominant at Akram Point, Haldikhali and Charaputia but adult age group were dominant at Akram point, Haldikhali and Charaputia.

30<sup>th</sup> Monitoring, November, 2021

Note: N.B.: Colour ranges from deepest green to deepest red. 0-4.99% Occurrence signifies Deepest Green; 5-9.99%-Shaded Green; 11-14.99%-Normal Green; 15-19.99%-Light Green; 20-24.99%; 25-29.99%-Lightest Green; 30-34.99%; 35-39.99%; 40-44.99; 45-49.99; 50-54.99-Light Magenta; 55-59.99-Deep Magenta; 60-64.99%; 65-69.99%; 70-74.99%; 75-79.99%-Light Red; 80-84.99%-Deep Red; 85-89.99%; 90-94.99%; 95-100%-Deepest Red

### Fish Migration

#### Migratory Species Diversity

Migratory species were identified by analyzing the common species available in the regular catch from the sampling sites. Fish species like Paissa, Datina and Poa attain the maximum abundance among the migratory fish species observed in the 31<sup>st</sup> quarter of monitoring. The relative abundance of the migratory species is given below in the **Figure 3.7**.

**Figure 3.7: Relative abundance of major migratory fish species in sampling sites**

#### Migration Extent, Time and Purpose

Major fish species showed interesting pattern in distribution for exploiting different purposes mentioned in the following table all along the sampling sites. Among migratory species, Paissa and Poa were observed to migrate long distance (**Figure 3.8 and Table D.6 of Appendix-IV**).

**Figure 3.8: Migration extent of major migratory fish species in sampling sites**

#### *Shrimp/Fish Farm*

Three farms situated in the direct impact zone of Power Plant were surveyed for monitoring shrimp/fish. Stocking pattern of the shrimp/fish farm is one of the major issues for successful production because of having natural genetic resources from the wild source of the Passur River System. Moreover, maximization of growth rate and minimization of mortality rate should be ensured for getting more economical output from the farms. So, stocking pattern, growth rate and mortality rate and its causes were surveyed intensively.

#### *Stocking Pattern*

It is reported by the farmers of the shrimp farms that no fish stock was done in the shrimp farm during this monitoring phase.

#### *Shrimp/Fish Growth Rate and Mortality*

During the 30<sup>th</sup> quarter of monitoring, the highest growth rate was observed in the Kapashdanga Gher followed by Rajnagar and Chunkuri (Table 3.6 and Table 3.7).

**Table 3.6: Growth Rate and Mortality of Fish/Shrimp (1st to 13th QM)**

*Fish Production**Capture Fish Production*

The present study revealed that the highest catch susceptibility was also found in case of Charpata Jal (30 kg/haul) shown in **Table 3.8**. In 31<sup>st</sup> quarter monitoring, the highest productivity was found at Akram Point followed by Charaputia and Haldikhali (**Table 3.9**). It is to be noted that fries found in catch were not considered in the productivity assessment. Monitoring of fishing activities as observed are shown in **Figure 3.9**

**Table 3.8: Total Catch in Different Gears in the Sampling Sites**

Figure 3.9: Monitoring Fishing activities at different locations of the study area

### Culture Fish Production

The present study on shrimp/fish farm in the 31<sup>st</sup> quarter monitoring phase was not observed fish production as it was fish stocking phase (**Table D-7, Appendix-IV**).

## **3.2 Monitoring of Ecosystem and Bio-diversity**

### **3.2.1 Indicators Selection**

Indicators for terrestrial and aquatic ecosystems have been selected by prior anticipation of probable impacts on ecological resources in different phases of the proposed project.

Composition and diversity of flora is important for vegetation study which indicates vegetation structure of an area. Plant health is directly related with biomass productivity. Plant health of an area may change for changing of different environmental parameters like temperature, composition of gaseous components, soil salinity, humidity and nutrients, air particulate dust etc. Plant diseases and proportion of healthy/unhealthy plant is needed to observe for ensuring plant health condition.

Canopy status of terrestrial vegetation indicates plant health and biomass properties of an area. Vegetation canopy structure may be change for change of plant growth rate due to soil properties change, plant physiological disorders due to change of climatic parameters or even for different human interventions. To monitor vegetation canopy status of the study area, canopy cover has been followed in different time intervals.

Among the terrestrial faunal community, Bird is an important class that is sensitive to their habitat condition. Changes of environmental parameters, land use and vegetation composition directly impact on bird's habitat of a locality. Broadly, two types of bird are found in an area; local and migratory. To observe local bird habitat suitability, number of bird nest and nesting bird species can be a good indicator. Numbers of wetlands where migratory birds come in each migration season have also been considered to observing migratory bird habitat suitability of the area.

In the respects of aquatic ecosystems, dolphin is an ecological indicator which indicates water quality as well as aquatic habitat suitability. This aquatic mammal is still present all the river systems of the study area. Any changes of water quality and river bed siltation may change dolphin occurrence in a river system. So, dolphin occurrence is needed to monitor for this study.

### **3.2.2 Rationales for Selection of Locations**

4 homesteads have been selected for monitoring terrestrial ecosystem's indicators of the study area. Locations of the homesteads have been selected considering wind direction and spatial distribution from the project boundary. All the selected locations for terrestrial ecosystem monitoring is at northern sites as maximum time of the wind rose south to north direction and anticipated impacts will be take part according to this area. Beside this, Sundarban Reserve Forest is located sum of 14 km south from the project and various indicators of different locations of this forest is also observing for forest health monitoring. So, no site has been selected at south site of the proposed project.

### **3.2.3 Terrestrial Ecosystem**

Terrestrial ecosystem supports most of the floral and faunal communities which are directly related to the environmental parameters like temperatures, air quality, sunlight, soil nutrients etc. In the study area, homesteads occupy maximum portions of terrestrial ecosystems. As such, observation on different indicators of selected homestead vegetation and dweller wildlife will be helpful to know the ecological impacts for the proposed project.

### *Description of the selected homestead*

The homestead in Rajnagar is located at 2.5 km. east from upper North-east boundary of the project site. This is situated inside the damp area as numerous small swamps exist inside and surround the homesteads. Water retention capacity of surface soil of this homestead is very low and for this reason very little number of grasses and other herbs are present. Land elevation of selected homestead at Kalekarber village is comparatively flood free. This is located at about 1.8 km. east from Middle-east boundary of the project. Chalkghona village is located about 0.5 km south from south-east boundary of the project. The selected homestead of this village is close to Maidara River to its north side and saline water shrimp farms to its south periphery. Presence of shallow ditches and peripheral waterbodies support to grow staple coverage of saline tolerant plant species. Borni village is located at about 3.0 km north from north-east boundary. Sampled homestead at Borni is situated at the middle part of the village. This homestead is also dominated by planted tree species and soil condition is similar to Rajnagar site. Vegetation of this homestead have been severely been damaged by past Cyclone Aila.

### *Species Composition of selected homestead vegetation*

#### Homestead at Rajnagar

Once, this homestead was dominated with Gewa (*Excoecaria agallocha*) among all the trees due to its height population which get favor from soil's salinity for luxurious succession. But at ending of the year 2020, the homestead owner re-developed the homestead platform by filling sand extracted from nearer canal beds. Due to this activity, a staple portion of the Gewa coverage has been damaged along with other tree species. As a result, it is difficult to indicate the dominated tree species of this site. However, monocots fruits including Narikel (*Cocos nucifera*) and Khejur (*Phoenix sylvestris*) occupied the top canopy of the vegetation. Beside this, Safeda (*Manilkara zapota*) and Boro (Zizyphus sp) are the two species of fruit yielding trees. In addition, a number of Bola (*Hibiscus tiliaceus*), Kewra (*Sonneratia apetala*) and one Sundari (*Heritiera fomes*) also found to exist. The homestead was cover very few grasses or undergrowth vegetation which also have been scarce after the land re-development.

#### Homestead at Kalekarber dighi

Two species like Narikel (*Cocos nucifera*) and Khejur (*Phoenix sylvestris*) occupies the top canopy. The homestead has many Mahagoni (*Swietenia mahagoni*) saplings which population is also high. Aam (*Mangifera indica*), Safeda (*Manilkara zapota*), Peyara (*Psidium guajava*) and Boro (Zizyphus sp) are common trees height not more than 7 m. Mahagoni (*Swietenia mahagoni*), Rendi Koro (Albizia saman) and Raj Koro (A. richardiana) are timber trees those are occupied top canopy height more than 10m. Beside this, Neem (*Azadirachta indica*), Bakul (*Mimusops elengii*) and few numbers of Kola (Musa sp) are found on these homestead platforms.

#### Homestead at Chalkghona

Vegetation of this homestead also have rich population of mangrove plant species like Gewa (*Excoecaria agallocha*), Gol (*Nipa fruticans*), Kewra (*Sonneratia apetala*), and Ora (*Sonneratia caseolaris*). Narikel is the dominating tree species as well as occupying the top canopy. As the homestead is near the peripheries of river and shrimp gher, soil salinity supports luxurious growth of mangrove plant. This homestead has two shallow ditches which contain brackish water throughout the year. A number of ornamental plants also observed on this homestead platform.

#### Homestead at Barni

A total of 38 tree species have been recorded through quadrat sample survey of this homestead. Of which, Rendi Koro (Albizia saman), Mahagoni (*Swietenia mahagoni*), Taal (*Borassus flabellifer*), Narikel (*Cocos nucifera*), Khejur (*Phoenix sylvestris*) are referable. The home owner has planted many fruit yielding trees which is now in sapling form. Among this, Kotbel (*Limonia acidissima*), Aam (*Mangifera indica*) and Safeda

(*Manilkara zapota*) are common. Gewa (*Excoecaria agallocha*) was dominated at western part of this homestead now being less populated due to fell by the house owner. Tiger Fern (*Acrostichum aureum*) is a mangrove herb which presence at here also referable.

Random quadrat vegetation survey has been conducted at selected homesteads during recent monitoring tier. A total of 38 plant species (excluding undergrowths) has been recorded from 16 number of surveyed sample quadrates which Shanon-Winner Diversity Index were Details of the survey result is presented in **Table 3.11**.

Plant species diversity followed more than the previous monitoring.

#### *Plant Health*

Structure of vegetation community of this area is tree dominant. Random saline water shrimp farming is a big threat to plant health of this area. Hence, Plant health of this area is not satisfactory. Expansion of shrimp farming in this area triggered incetion of salinity of soils. For this reason, overall plant succession, growth and productivity have changed day by day.

#### *Plant Diseases and symptoms in homestead vegetation*

Plant diseases observation of an area is needed to evaluate plant health and productivity. During initial field survey, some tree species were selected for regular observation of plant disease. In this regard, a number of common tree species have been observed in each homestead.

Leaf blast, Leaf spot, lethal yellowing, nut fall, Mite damage on nut fruit are common diseases of the plants in the study area. A brief discussion was held with home owners about diseases of selected economic plants which exist in their homesteads. Most symptoms for plant diseases are descriptive. Although, all plant diseases symptoms are not visible in a same time of the year, but it was tried to observe the existing disease symptoms. Leaf spot and mite damage on fruits is the common symptoms of *Cocos nucifera*. In addition, bud/trunk rot (Heart Rot), lethal yellowing and diameter loss at top portion of this monocot is also common symptom of this plant in all location. Infection of fungal/bacterial is not remarkable all the homesteads. But Leaf Anthracnose on *Mangifera indica* and Bacteriosis on *Psidium guajava* is commonly found most of the trees. *Phoenix sylvestris* also found unhealthy due to leaf yellowing from manganese deficiency.

#### *Number of diseases affected trees*

Plant health has been more or less same at three sites except Rajnagar. Health of monocot like Coconut and Date Palm has improved. This improvement may be due to reduction of soil salinity for improving drainage condition. Comparing to same season monitoring in previous tier (Nov, 2021), the present year shows slight improving trend (**Table 3.12**).

#### *Vegetation canopy status*

#### *Species representation in different canopy layers of homestead vegetation*

Coconut (*Cocos nucifera*) occupied top canopy of all the studied homestead vegetation. Date Palm (*Phoenix sylvestris*) is prevalent as second top layer followed by Gewa (*Excoecaria agallocha*). Most of the fruit yielding trees like Sofeda (*Manilkara zapota*), Mango (*Mangifera indica*) possess upper bole of canopy layer. Lower bole is occupied by small fruit yielding trees like Guava (*Psidium guajava*), Musa sp. Very few grass species and undergrowth vegetation were followed at studied homesteads.

Estimated Canopy cover in homestead vegetation of sampling sites

Canopy cover has been slightly reduced all the sites due to falling leaves for seasonal effects. Overall canopy coverage in all the sites are revealed insignificant improvement comparing the same seasonal monitoring in Jan 2021 (**Table 3.10**). Canopy coverage of the studied homesteads has been represented in following table.

**Table 3.10: Vegetation Canopy Cover in different studied homesteads**

### Bird Habitat

#### Local birds and their nesting behaviour

Numerous local bird species are occurred in the study area. Homestead vegetation are the prime habitat for local birds. Existence of vast shrimp farms as well as canals and rivers also favor good number of water dependent bird species in this area. Most of the birds are nesting on tall trees of homesteads. Small bird like Tailor bird, prefer small bushy shrubs. Although, birds do not follow any local boundaries, a clear conception on available bird species have been gathered through discussions with studied homestead owners as well as physical observation.

#### Bird species and number of Bird nests in sampling sites

None of the bird nest have been recorded from any monitoring homestead site. However, **Table3.13** represent the bird nest monitoring datasheet over the monitoring periods.

**Table 3.13: Bird nest observation datasheet**

#### Migratory birds and their habitats

Migratory and local migratory winter birds follow at large shrimp gher along the study area. According to local people and physical observation, Common Coot, Common Snipe, Black Winged Stilt, Ruddy Shelduck, Little Grebe etc are common winter visitor of this area. In addition, local Ruddy Breasted Crake, Common Sandpiper, Great Egret, Pond Heron, Little Cormorant are also found at most of the monitoring wetlands of the study area.

Out of 8 sites, 7 sites wetlands recorded the presence of local migratory birds except Sukhriar Gher. Occurrence of local migratory birds was high at Borocharar Gher. Overseas migratory birds have informed only at Boro Charar Gher like previous monitoring. But the population is very low as previous years. According to local knowledgeable presence of migratory birds are scatter in some beels with low population due to re-starting shrimp culture within short intervals from shrimp harvesting in past year and indiscriminate use of pesticides in agriculture field and shrimp farms. In addition to this, noise from construction vehicle movement through the Power Plan approach road, noise from the construction sites during night, vehicle and construction lightings are disturbing the migratory birds which are roaming at the nearby wetland (shrimp farms) like Boro Charargher. Following **Table 3.14** show the presence of migratory birds at the important wetlands inside the study area.

**Table 3.14: Presence of migratory birds at different wetland inside the study area**

Wetland Name	Wetland type	Approximate distance from project Boundary (Km.)	Presence of Birds

#### **3.2.4 Aquatic Ecosystem Monitoring**

Rivers, canals, ponds and saline water shrimp farms are main wetland forms in the study area. Of which, river bear the flowing/ lotic and ponds bear the stagnant/lentic water systems. Canals of this area have merged with shrimp farms. Shrimp farms extend a large proportion of total watershed of the study area those are intervene by human. Therefore, canals are not an actual flowing or stagnant water system.

### *Monitoring Locations*

Passur is the only external river beside the project area which maintains connectivity with all flowing water systems of the study area. On the other hand, Maidara River including two branches (Saitakhali and Ichamoti) exists as an internal river system. Both of the river systems are support River Dolphin whole of the year. Hence, status of aquatic mammals (Dolphin) in these river systems has been monitored.

### *Dolphin Occurrences*

#### *Dolphin migration route in the study area*

Two dolphin species (Ganges River Dolphin and Irrawaddi Dolphin) travel throughout the Passur River for whole of the year. The Ganges River dolphin migrates from estuary regions to upstream connected rivers like Rupsha and Madhumoti. Though Irrawardi Dolphin is mostly habituated in estuary regions of Bangladesh, but this aquatic mammal is also occasionally sighted in Passur River. Ganges Dolphins also roam through Maidara River mainly during high tide. Siltation and narrowing of upstream branches are limiting the length of migration area of this river day by day.

#### *Dolphin occurrence in Passur and Maidara River*

Presence of Dolphin have been surveyed within 15 km length of Passur and Maidara river surround the project area (From Digraz Kheyaghat to Chalna including Maidara River) through boat transact during full tide. A total of 9 dolphins have been recorded in this survey. Of which 8 individuals have sighted in Maidara River and lest one recorded within Passur River. The encounter rate is 0.25 individual/km/hr which is insignificantly higher than previous monitoring tier. **Figure 3.11** represents the survey transact and location of dolphin occurrence within these river channels. Dolphin sighting at Maidara River in shown in **Figure 3.10**

**Figure 3.10: Dolphin sign within Maidara River**

#### *Dolphin occurrence in Dhangmari Khal, Shella Gang and Bhadra khal*

Four Dolphins were sighted in Shella Gang while 8.5 km transact survey conducted from Chandpai to Joymonirgol Thota to Food Silo to Joymonirgol Thota (**Figure 3.12**). The occurrence rate was 0.53 individual/km/hour.

A total of 17 dolphins have been recorded at Bhadra Khal during 42 min survey time and the 3.5 km inner reach from Bhadra Patrol Post. The encounter rate was 5.32 individuals/km/hr. The encounter rate was higher than the previous monitoring and this may be due to increase fish abundance within this khal for stringent of fishing activity by BFD within this tributary of Passur River. The distribution of dolphin occurrence at Bhadra Khal is presented in **Figure 3.13**.

Another short survey was conducted Karomjal, Harbaria and Akram Point while passing the river. Dolphin has been notified at Karamjal and Harbaria while travelling on boat. However, the survey result is included in **Table: 3.15**.

### 3.2.5 Status of benthos and planktons in river systems

Benthos and plankton sample have been collected from 7 different locations of Passur and Maidara rivers during different tidal conditions in February 2022. Detail status of benthos and planktons from recent survey will be incorporated with next monitoring report after getting the laboratory analysis report.

#### Species Composition of Benthos

From the last year monitoring during November, 2021, only Polychaeta larvae was recorded in Passur River water at Monla-Passur confluence point.

#### Species Composition of Plankton

Phytoplankton: A total of 33 phytoplankton species were recorded from the 5 locations of river water and two locations of inland freshwater ponds. 9 phytoplankton has been recorded from Passur and Maidara River. Out of which, Raphidiopsis mediterranea skuja and Rhodophyta are abundant both of the river water. The lentic aquatic ecosystem supports highest population and highest species diversity. Kalekarber Dighi and Gardaskathi pond support 23 phytoplankton species. Alexandriumcyst, Coscinodiscus granii Gough, Oscillatoria princeps etc are the dominant species. Species composition and abundance of Phytoplankton in different monitoring locations have been listed in following Table (Table 3.16).

**Table 3.16: Species composition and abundance of Phytoplankton in different monitoring locations**

### 3.3 Sundarbans Forest Health monitoring

#### 3.3.1 Background

Forest health monitoring (FHM) is concerned with the ecosystem's health. Monitoring forest cover and functions provide data that can be used to influence policies and decisions on how to conserve, protect, and manage forests sustainably. Forests are an important aspect of our country's landscape. The Forest Health Monitoring program is designed to determine the status, changes, and trends in indicators of forest condition on a certain time interval basis. The Forest Health Monitoring program analyzes data from a variety of sources, including ground plots (i.e. long-term monitoring plots), aerial surveys, and other biotic and abiotic data sources, to address forest health issues that threaten forest ecosystem sustainability. One

of the widely used forest healthy monitoring Bio-indicators is the growth trend over time and its relation to leaf area index (Beets and Whitehead, 1996). Stands with a high leaf area index will accumulate more biomass and total volume per ha than stands with a low leaf area, other things being equal (Beets et al., 2008). Lichen abundance is another good indicator of forest health. Because lichens are very sensitive to air pollution particularly to sulfur dioxide, fluoride, and ammonia. Their presence or absence is an indicator of forest health. Mangrove trees can acclimatize to anaerobic and water-logged conditions by increasing their number of pneumatophores. Another indicator is Crab which effectively remove nitrogen from the aquatic ecosystem in the form of gaseous nitrogen ( $N_2$ ) and nitrous oxide ( $N_2O$ ) (Lee, 1989), and can improve oxygen content in the soil layer (Amarasinghe, 2009). The quality of the soil in a forest is also important indicator of forest health (USDA Forest Service. 2007). An evaluation of soil quality usually involves measuring the soil's physical, chemical, and biological makeup at different depths. Plant species diversity is another Bio-indicator of a healthy forest. One way to assess this diversity is to determine whether there is a mix of plant species of different sizes and ages, thus creating forest "layers" that provide habitat for many species (Greenleaf Forestry and Wood Products Inc. 2010). A healthy forest has a good regeneration capacity, which is also a bio-indicator of forest health monitoring. These bio-indicators will be investigated in Sundarbans Reserve Forest (SRF) in light of the Rampal Power Plant Installation.

The state of the forest to monitor the potential impacts of the Rampal Thermal Coal Power Plant Project, bio-indicators will be used in the Sundarbans Reserve Forest (SRF). It is necessary to establish a baseline state in order to determine the genuine scenario of power plant impact on forest health. In light of this, CEGIS is implementing a forest health monitoring study at five Sundarbans Reserve Forest (SRF) locations along the Passur River: Sutarkhali, Karamjal, Harbaria, Akram Point, and Hiron Point. Tree height and diameter, regeneration capacity, crab activity, plant diversity, biomass, and carbon stock were among the indicators monitored in this program.

### 3.3.2 Methodology

#### *Permanent Sample Plot (PSP) Establishment and Layout*

To set up permanent sample plots, five plots were established. Among those, five sites are along the Passur River at Karamjal, Harbaria, Akram point and in Hiron point respectively and the fifth plot is near Sutarkhali forest office (**Table 3.18**). The sites were selected considering the distance from the proposed project site, wind directions, coal transportation route, river systems and vegetation types. In this present census, *Hiron* point was not considered.

#### *Bio-Indicators for Forest Health Monitoring*

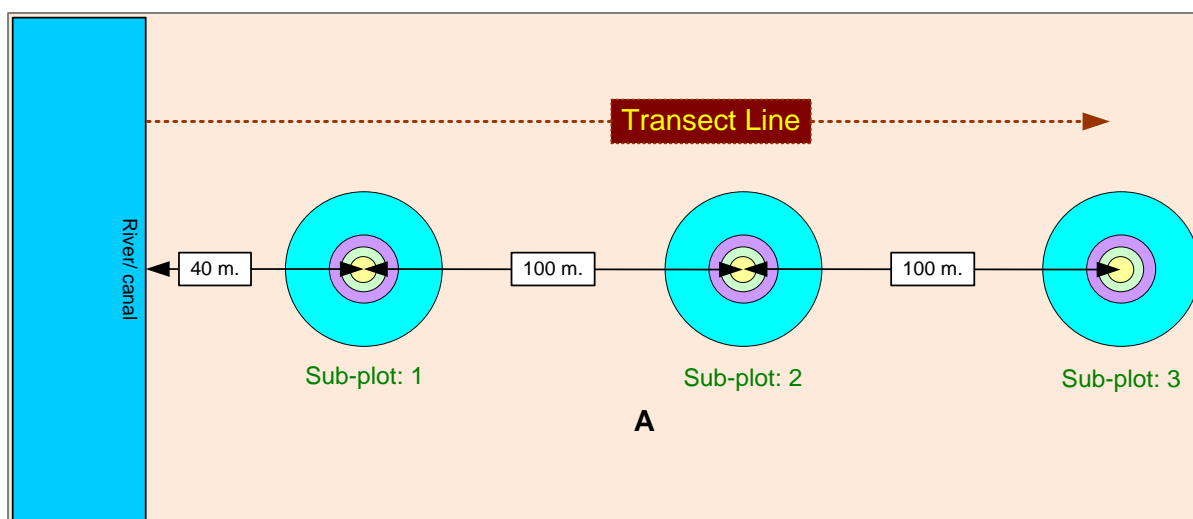

There are many Bio-indicators for forest health monitoring. As the study forest is a mangrove forest, some of the mangrove traits were also selected as Bio-indicator. The Bio-indicators observed in this forest health monitoring program were seedling regeneration, pneumatophores, species diversity, crab hole density, canopy cover, leaf phenology, Leaf Area Index, Tree growth, phenological behaviour, pest and disease.

#### *Sampling Design of Permanent Sample Plots (PSPs)*

In each site, a transect line was laid out perpendicular to river or canal bank. Along the transect line, three circular nested subplots of 12.62m radius have been laid out at 100m intervals in order to capture the maximum tree species (**Figure 3.15**). Because of the variation in species composition in SRF, observation plots were laid out from the coast, river or canal side to upper slope zone where forest area is denser. The location of the first subplot was 40m away from ecotone zone in order to save the subplot from river bank erosion. Each subplot was again subdivided into four quadrates (**Figure 3.16**) during this monitoring period 50% of the sub plot 1 at Hironpoint is eroded and 10 m of the subplot 1 at Akram point is eroded due to high tidal inundation and erosion.

**Table 3.18: General Description of Permanent Sampling Plots (PSPs)**

Transect	Plot	Range	Compartment No.	GPS $\pm$ (m)		Soil Description	Plot Location Notes
				Latitude (N)	Longitude (E)		
Sutar khali	1	Khulna	32	22.4981	89.4875	Hard Clay	Just opposite from Sutar Khali Forest Station and 40m SW from Sutar Khali Canal

	3	Khulna	44	22.1833	89.5000	Hard Clay	648m south east from Shibsha River

**Figure 3.15: Layout of the Subplots and Transect Line Perpendicular from Ecotone (river or canal bank)**

Figure 3.16: Layout of the Survey Activities in each Subplot

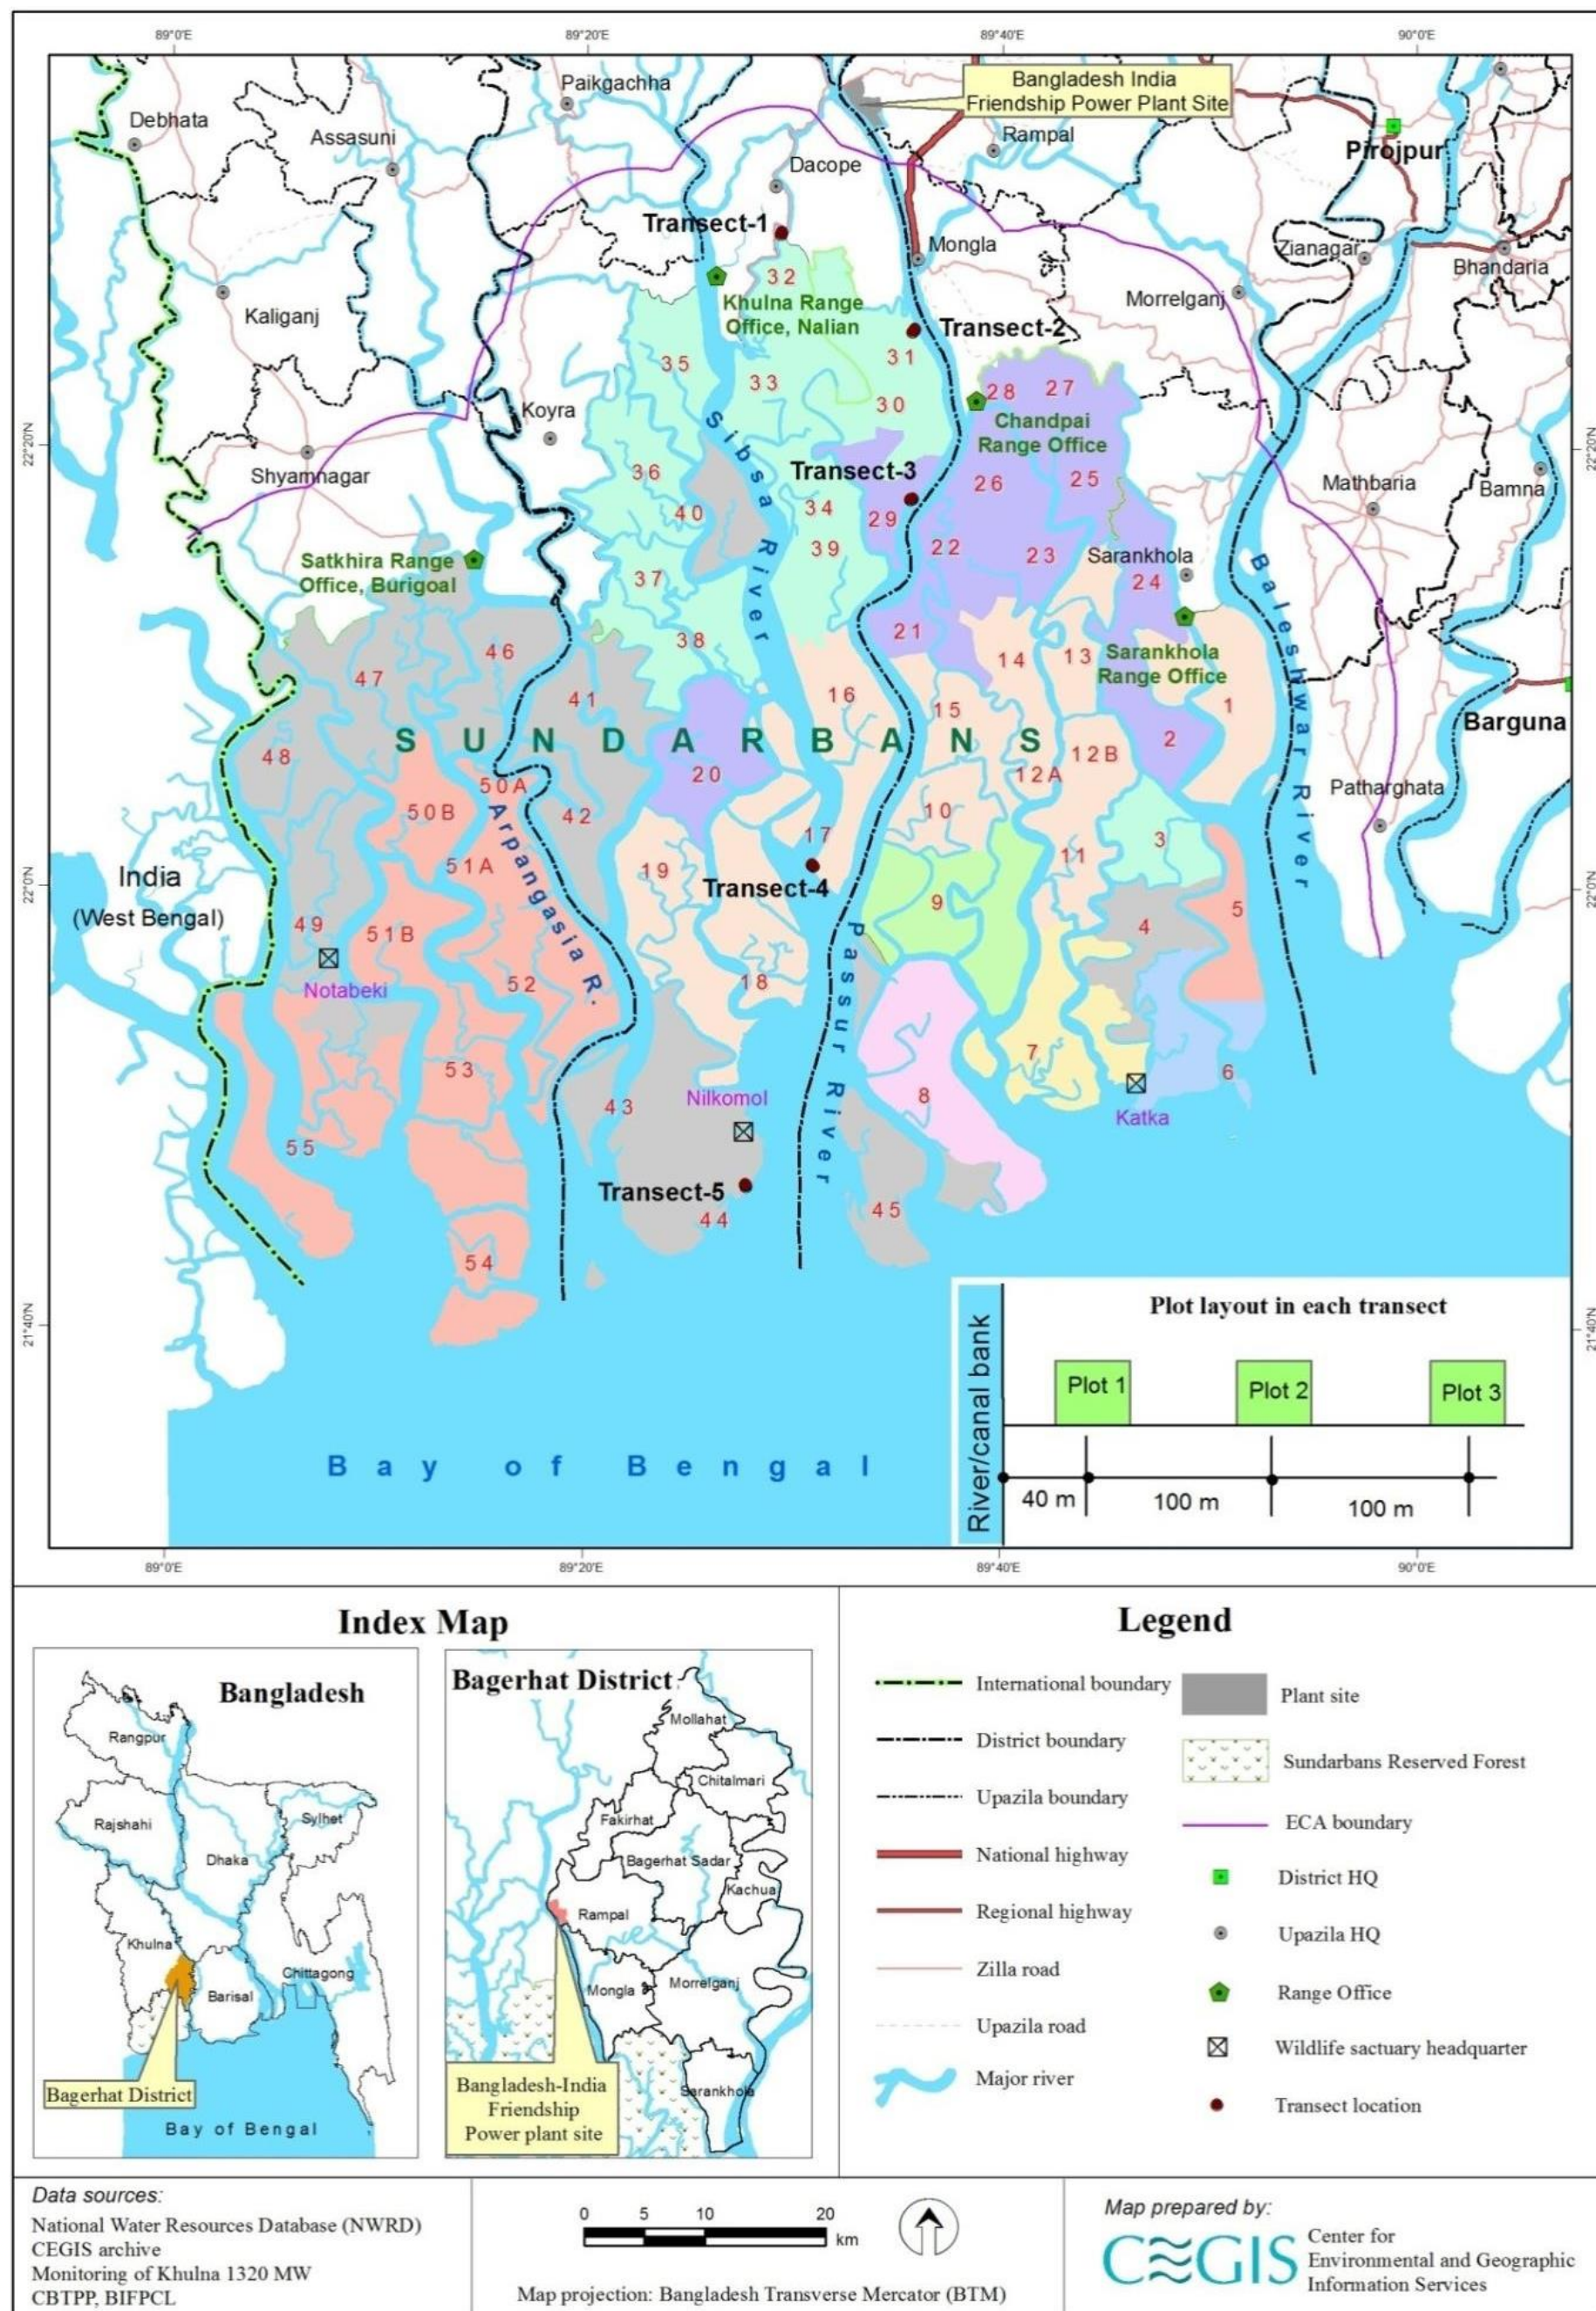

Figure 3.14: Location Map of Sundarbans Forest Health Monitoring Plots (PSP)

### *Tree growth*

Tree species growth data were obtained from measured tree DBH. Individual tree DBH  $\geq 5\text{cm}$  was considered for growth trend observation.

### *Vegetation Diversity*

Tree species data were collected from the PSPs. Individual tree DBH  $\geq 5\text{cm}$  was considered. Saplings (DBH  $< 5\text{cm}$  and height  $< 1.37\text{m}$ ) and seedlings (height  $< 1.37\text{m}$ ) were assessed within a 3m and 2m radius circle respectively in each PSP. Seedlings were counted species wise and their status of living was also recorded. For saplings, species name and DBH were recorded along with the living status.

### *Biomass and carbon stock estimation in tree*

From each plot tree species were identified and each individual was recorded. Diameter at breast height (1.37m) and height was measured in the field. Total biomass of trees was estimated after adding above and below grounds biomass. As the study was conducted in a reserved forest area, it was not possible to cut all the trees and brought them to laboratory for estimating biomass. After reviewing models developed by several authors from across the world (e.g., FAO 1997, Brown et al. 1989), the generic allometric model developed by Chave et al. (2014) was used for measuring biomass as this widely used for tropical region tree standing biomass. Below ground biomass was calculated considering 15% of above ground biomass (Mac-Dicken 1997). After calculating biomass, carbon content was calculated based on the assumption that carbon content is 50 percent of the dry woody biomass (Brown 1997). Aboveground biomass and carbon was calculated on a per-hectare (ha) basis. The model for above ground biomass estimation is as follows:

$$AGB = 0.0673 \times (\rho D^2 H)^{0.976}$$

Where, Y = above ground biomass in Kg; H = Height of the trees in meter; D = Diameter at breast height (1.3m) in cm;  $\rho$  = Wood density in units of  $\text{g}/\text{cm}^3$ .

### *Pneumatophores*

The total numbers of living pneumatophores were recorded within a circular area of 1m radius centring each of the four points of all the subplots.

### *Crab hole*

Crab plays an important role in mangrove ecosystems such as decomposing litter fall which play an important role in increasing soil fertility. In order to record the crab density, crab hole abundance was monitored. For this purpose, the crab holes were counted within an area of 1m radius circle in each subplot's centre and in the midpoint of four transect.

### *Canopy Cover*

Canopy cover percentage was estimated by a spherical densitometer (i.e. Densitometers a gridded convex mirror that provides a simple and inexpensive approach of measuring canopy cover). The densitometer was held at a distance of 30–40 cm from the body and at an elbow height so that head not become visible in the mirror. After levelling the instrument using the level bubble, the dots which had not been occupied by canopy were systematically counted. In each subplot, the meter readings have been taken at four points facing north, south, east, and west direction including the centre point of the subplot. The canopy cover was calculated by taking the average of these readings.

### Leaf Area Index

Leaf Area Index (LAI) is a key structural characteristic of forest ecosystems because of the role of green leaves in controlling many biological and physical processes in plant canopies. LAI influences net canopy photosynthesis. Light absorption by the forest canopy can be used to estimate Leaf Area Index (LAI). In this monitoring report, LAI was calculated as follows:

Leaf Area Index (LAI) =  $\log_e (I/I_0) / -K$  leaf area / area of ground (Where, I = Under Canopy Light Intensity,  $I_0$  = Open Canopy Light Intensity and K is Canopy light extension coefficient i.e., 0.5).

### Leaf Phenology

Leaf phenological trait of major mangrove species such as leaf emergence, leaf shedding, flowering and fruiting and fruit/ propagule dropping time was investigated through secondary information. Leaf phenology has been first introduced in this study for the first time. From next field inventory, leaf phenological behavioral change will be monitored.

### Woody Debris

Woody debris is defined as any dead woody materials (twigs, branches, or stems of trees or shrubs) that have fallen and lie up to a height of 2 meters above the forest floor. Dead trees that lean at an angle > 45° from true vertical were also counted (Donato, et al., 2009). The planar intersect technique involves counting intersections of woody pieces with a vertical sampling plane (transect) (Harmon et al., 1996) followed (Donato, et al., 2009). A survey tape was stretched from the subplot center for 10 meters in each of the 4 cardinal directions, oriented at 45° angles from the main transect line. A compass was used to run the transect tape on a straight line. Woody debris intersecting the transected plane was recorded, up to a height of 2 meters above the forest floor.

Woody debris was categorized into 4 size classes (**Table 3.19**): Small, Medium, Large, and Extra-Large. An aluminum down-wood gauge (Fuel Gauge) was used to determine the size class of each piece encountered.

**Table 3.19: Classification of Wooden Debris**

SI No	Classes	Size (in cm)
1	Small	0.0-0.6
2	Medium	0.6-2.5
3	Large	2.5-7.6
4	Extra-Large	≥ 7.6

Small, medium, and large pieces were tallied as the number of pieces that crossed the transect tape. For Extra-large pieces, the actual diameter over which the transect line was crossed, was measured and the decay status was also recorded as sound (machete bounces off or only sinks slightly when struck) or rotten (machete sinks deeply and wood is crumbly with significant loss). Each of the transect lines was made into sub-sections and these sub-sections start from the distal end of the transect (meter 12.62). Small pieces were only tallied for 2 meters of the transect (from meter 12.62 to meter 10.62). Medium pieces were only tallied for 5 meters of the transect (from meter 12.62 to meter 7.62) and the large and extra-large pieces were measured along the 12.62-meter transect

### 3.3.3 Results and Discussion

#### *Vegetation Diversity, Richness and Compositional Variation*

In comparison to Bangladesh's other forest types, the Sundarban mangrove forest is a unique plant ecosystem and diversified place. The distribution of plant species in the Sundarban is influenced by saline water. Halophytic tree species dominate the Sundarbans' natural vegetation. The patterns of plant dispersal in various locations are depicted in **Figure 3.17**. Healthy *Heritiera fomes* trees dominate the Sutarkhali area, with *Excoecaria agallocha* and *Xylocarpus* species following closely after. The Karamjol area, which is

less populated than other areas, is dominated by *Heritiera fomes*, *Excoecaria agallocha*, and *Bruguiera* spp. The species composition is higher in Karamjal, however. The Herbaria zone is dominated and disseminated by *Excoecaria agallocha* and *Heritiera fomes*, which, despite growing well in this zone, show top dying symptoms. In the Akram point area, *Excoecaria agallocha*, *Heritiera fomes*, and *Ceriops decandra* cohabit. The major plant on Hiron Point is *Excoecaria agallocha*. In addition, *Heritiera fomes* and *Ceriops decandra* also found.

According to Shannon's diversity index, species diversity is comparatively higher in Karamjol and diversity gradually decreases towards the plot near the sea **Figure 3.18**. While Simpson's dominance index of trees increased from Karomjol to Hiron point. Thus, an inverse relationship between tree dominance and diversity was observed with the distribution. Species diversity order in five locations are: Karamjol(1.531)>Herbaria (0.947)>Akram point(0.751)>Sutarkhali(0.546)>Hiron point(0.369). These indicate that the Sundarbans biodiversity is much richer in the oligohaline or low saline zones in comparison to that of the polyhaline or mesohaline zones i.e. biodiversity varies salinity gradient-wise

Figure 3.17: Dominated tree species status in 5 plots

Figure 3.18: Species diversity in 5 plots

### Carbon stock in trees

Comparing the carbon stock (mt/ha) of the mangrove stand within the plots of Sundarban in this (31<sup>st</sup>) monitoring period, the Sutarkhali range was found to have the maximum carbon stock with 4281 mt/ha with a recruit density of 106 trees/ha. The lowest carbon stock was observed in Karamjol (1073 mt/ha) with a recruit density of 39 trees/ha. Hiron point was found the second-highest carbon stock of 3123 mt/ha with a tree density of 95 trees/ha. Carbon stock in Herbaria and Akram Point was found at 2519 mt/ha and 1937 mt/ha respectively with a density of 68 and 71 tree/ha. However, a significant (ANOVA,  $P < 0.05$ ) variation was observed for Carbon stock among five sites. The total carbon stock in five locations of the Sundarbans is in the order of Sutar Khali > Hiron Point > Harbaria > Akram Point > Karamjol (**Figure 3.19**). The difference in the carbon stocks in the vegetation biomass of mangrove systems in different zones may be attributed to the structural peculiarities of the stands in each region (Kasawani et al. 2007).

**Figure 3.19: Carbon stock variation in five (5) plots**

### Status of Forest Health Indicator

In comparison with the (28th) monitoring period to check the seasonal variation, it has been found that the average number of pneumatophores per hectare increased in Sutarkhali, Karmjal, and Herbaria, but decreased in Akram point, while pneumatophores density was at highest in karamjol sample plots. However, there is no significant variation ( $p > 0.05$ ) in pneumatophores density over the monitoring period for each PSP (**Figure 3.20**). An increasing pattern of pneumatophore density indicates a healthy forest ecosystem.

**Figure 3.20: Seasonal variation in Pneumetaphore density**

Measuring tree Height at Harbaria by TruPulse 360B Laser Rangefinder

Data recording at Karamjal point

Measuring tree diameter at DBH

Taking Canopy Coverage by spherical densitometer

Crab mound is found to be higher at Akram point during this survey time where crab hole density is higher. Crab hole density has increased in all plots from the previous year but did not vary significantly ( $P > 0.05$ ) across the monitoring period (**Figure 3.21**). This indicates that crab activity rises at the forest floor, causing the soil to become more aerobic, allowing for faster decomposition of organic matter which is a good indication for forest health.

**Figure 3.21: Crab hole density status from previous seasonal monitoring period**

The Seedling density among five PSPs did not vary significantly ( $P>0.05$ ) from the previous (28<sup>th</sup>) monitoring period (**Figure 3.22**) but seedling density decreased in all plots except Akram point. Nutrients limitation and salinity conditions may affect the survival of seedling growth.

**Figure 3.22: Seedling density status from previous seasonal monitoring period**

Canopy coverage is nearly the same in all sites and does not differ significantly ( $P>0.05$ ) from the previous tier (28<sup>th</sup>). When compared to the rest of PSP's canopy cover percentage, canopy coverage at Akram point was lower (**Figure 3.23**)

**Figure 3.23: Canopy coverage status from previous seasonal monitoring period**

The light intensity status from the preceding monitoring period is shown in **Figure 3.24** where it appears that light intensity falls at Akram points while increasing at Karamjol, Sutarkhali, and Harbaria. The daily rate of net canopy photosynthesis is influenced by the LAI (Light Area Index), which results in an exchange of atmospheric CO<sub>2</sub>. The minimum ratio of under canopy to open canopy light intensity value indicates the maximum LAI. However, no variation ( $P>0.05$ ) was observed in light intensity within the PSP and from the previous tier (**Figure 3.24**).

**Figure 3.24: Seasonal variation of light intensity from last year's monitoring period**

There were no changes observed in the phenological behavior of the dominant tree species during the monitoring period. However, the 'top dying' of Sundari was observed in all the PSPs. In addition, parasite was observed mostly in all of the Sundari trees. During this monitoring period, the Hiron point plot has a high death rate of Goran species as the plot is fully carpeted with sand due to natural reasons that are alarming for future growth of trees in this plot.

**Figure 3.25: Wood debris classes and variation in 5 plots**

Wood debris of small size classes has been found more abundant in all sampling plots than in other classes and the Sutarkhali plot has the highest quantity of small wood debris (**Figure 3.25**). This is maybe due to the high density of healthy trees present in the sites than in other sampling sites. Medium-sized wood debris quantity found highest in Harbaria point as the forest floor covered with a high death rate of Goran tree due to sand carpeting. Negligible amounts of sound and rotten deadwood were found in all study areas. Although differences in the amount of wood debris among the 5 PSPs were not statistically significant ( $P>0.05$ ). Medium, Large and sound wood is found highest in Hiron point comparatively the other plots.

Note: Each year represent average of four monitoring periods.

**Figure 3.26: Pneumatophore Density, Crab Hole Density, Seedling Density, LAI, and Canopy Coverage over different census period (N.B. Each year represent an average of 4 monitoring period except for the 8<sup>th</sup> year)**

Among the five monitoring sites, the mean pneumatophore density is found lower in Akram point and higher in karamjal due to floristic composition (**Figure 3.26**). From the last field observations, it was found that Akram point is mainly dominated by Gewa that may influence pneumatophore generations. On the contrary, Karamjal is the most diversified plot with the composition of Sundri, Gewa, and Kankra trees which may favor pneumatophore generations. The number of pneumatophores may also vary due to the elevation of the forest floor from the mean sea level (MSL). The major function of pneumatophores is to exchange gas into the atmosphere during tidal inundation. Hence, the highly elevated plot with less effect of inundation may have a lesser number of pneumatophores.

The crab hole density, the indicator of the availability of crab in a site, has been found highest at Akram point among the monitoring sites during the last several monitoring periods. However, it is difficult to predict any relationship between changing crab hole density and seasonal variability from quarterly survey findings (**Figure 3.26**). But there may have a reverse relationship between crab hole and other indicators (seedlings, pneumatophore density) as those indicators are found lowest in Akram point.

From the last field observation, it was found that the number of seedlings per hectare has been reduced in almost all the monitoring locations except Sutarkhali (**Figure 3.26**). Overall in Akram point, the seedling's status is comparatively lower. Seedlings usually die at the early stage in the natural forest due to competition for nutrients as well as light intensity. Other than the silvicultural competition, the seedlings at Akram point and Hiron point also face natural stresses due to their location very close to the sea.

In the monitoring plots, the canopy cover percentages have not varied significantly. It is found that the canopy cover percentages are similar among the monitoring sites (**Figure 3.26**). Since greater than 60% of canopy coverage in a site is treated as healthy, all the locations of the monitoring sites are in good shape.

The LAI (Leaf Area Index) influences the daily rate of net canopy photosynthesis, resulting in an exchange of atmospheric CO<sub>2</sub>. The minimum ratio of under canopy to open canopy light intensity value indicates the maximum LAI. It was found that the LAI has increased in all monitoring locations from the previous monitoring period except Akram Point and Sutarkhali (**Figure 3.26**).

In summary of the last monitoring activities, it can be predicted in terms of seedling density, pneumatophores, crab hole, canopy cover, and leaf area index (m<sup>2</sup> leaf area/m<sup>2</sup> ground area) that the forest condition is showing slow and static changes periodically, although there has some seasonal effect.

## 4. Social Environment

### 4.1 Introduction

Social safeguards refer to the policies, procedures, and measures intended to mitigate unintended negative impacts of the development projects. This safeguard monitoring is a follow-up study that occurred following the guidelines of DoE and Environmental Management Plan (EMP), suggested in the Environmental Impact Assessment (EIA) Report.

The objective of the social safeguard monitoring is to ensure compliance during the project's construction phase. The monitoring held to check the compliance status of the working environment, community safety and security and impact on livelihoods (due to project intervention), and status of Corporate Social Responsibility (CSR). Additionally, the Corrective Action Plan (CAP) suggested addressing the non-compliance issues based on the findings of the safeguard monitoring.

#### 4.1.1 Methodology

This monitoring was conducted using social data collection tools. There is consultation, informal interviews, and physical observation applied to collect data from the study area and the project area. The consultations were held at the MSTPP office and Niramoy Medical Center, whereas relevant project officials provided their feedback based on the checklist. In addition, physical observation and informal interviews were held with the workers and local people. The informal interview was carried out at Zero Point, Kapasdanga, Rajnagar, Gaurambha, Foylarbazaar, Borodurgapur, Rajnagar and labor sheds in the project area for getting people's/labors opinions about the safeguard issues.

#### 4.1.2 Results of Social Safeguard Status

##### *Impact on Employment and Livelihood*

According to the local inhabitants and the Project Management Unit (PMU), engagement of laborers is almost similar as it was in previous monitoring tenure. It is estimated that about 10% to 15% local labor force is working (during this monitoring phase) at the project site. According to the statement of local people of Gaurambha Union, more or less 100 to 150 laborers are regularly gone to work at the project site from this union. Now a days, the engagement of local labors is decreasing because of conducting more technical activities in the project site and relevant technicians are unavailable or rarely found in the study area. However, the scope of employment is increased in the study area because of fully operating widen and well-designed access road, bazaar at the zero point and other newly development initiatives (i.e. LPG industries, cement factories, solar power plant etc.) near to the project area. In addition, local people are trying to make some scope of developing small business opportunities which become possible especially due to the project intervention.

Already some local people of near villages are engaged in food, beverages, vegetable, mobile banking services and other service providing business/employment at the project adjacent area i.e. at the approach road side and within the labor sheds area which is found as the main earning sources of those households. Additionally, about 270 people were registered (under the motor vehicle federation) to run motor vehicles (i.e. easy bike, auto rickshaw and Van) at the approach road to carry both goods and passengers. As a result, it helps people to involve more earning opportunities than the previous time. Furthermore, local people started thinking to be skilled and also started learning welding, machinery works, electrical works to catch the future jobs related to the project as well as other scopes that will be developed in the future in this area.

Under the CSR activity, the project authority organized some trainings program related to ICT and sewing where the sewing machines were also provided to the trainees. Local people stated that some of those trainees utilized the trainings by involving in sewing related income generating activities. During critical

period of Covid pandemic, the MSTPP authority sewed 50,000 masks by these female trainees which also influenced them to professionally engage in this occupation. The MSTPP authority stated that they also have planned to engage those female in such types of activities in near future.

### *Working Environment*

From the very beginning of the Covid pandemic condition, BIFPCL and BHEL authority took necessary initiatives for building awareness and motivation among the laborers, in resulting affected number and severity rate is quite low among the laborers. Laborers got training about proper way of sanitization and using protective protocols with its necessity. Necessary equipment for protection and sanitization were provided in this regard. The PMU regularly monitors the safety issues keeping a good and friendly working environment. The tri-party coordination meeting was held with all safety officers from BIFPCL, BHEL, and other construction companies to ensure compliance with the working environment. Regular toolbox training is held every day before starting the construction activities. However, the “no training” and “no work” campaigns continue. The PMU monitors the issue, and without getting a pass from the safety exam, no new laborers can join as a working force at the project site.

Most of the labor sheds were found clean with adequate toilet facilities, drinking water facilities, proper drain out and waste management facilities. However, floor of a labor shed was found about 1 feet low from the ground level where rain water regularly entered during monsoon, but no such issues were found for remaining other sheds. Adequate measures were taken to handle the Covid pandemic situation inside of the project area. A total of six (6) oxygen cylinders and necessary medicines were taken to stand by for taking care the emergency situation and covid patients. A hospital with modern equipment, ICU bed, physiotherapy unit and permanent doctor, were set up by the PMU. Here, project officials and affected/injured labors get the emergency support. This ensures safeguards for officials as well as the construction workers.

**Figure 4.1: Safeguard Component at Niramoy Medical Center**

### *Community Health*

Local community did not raise any grievance regarding degradation of their health and safety issues due to the proposed project. For suppressing the dust, water sprayed daily in regular interval during dry season. According to the field findings, the local communities at Gaurambha and Rajnagar unions are not encountered noise problems due to the construction activities of MSTPP. According to the PMU, noise generating construction activities are almost ending up and they try to maintain DoE standard for conducting noise generating construction activities. They also try to develop a green environment in the peripheral of their premises following the conditions of DoE. In this regard, a number of mangroves, fruits, coconut, and herbal plants were planted in the project area and the program is still ongoing, though the survival rate of the plants (except mangrove trees) are not satisfactory. In this regard, a caretaker from the Forest Department is engaged for supervising the maintenance of the plants.

Figure 4.9: Socio-Economic Environment Monitoring Location

According to the caretaker, soil and environment of this area is friendly for the mangrove trees while other families of trees have to struggle a lot for its survival. Also, the mangrove trees are naturally grown through its seeds, so these trees were suggested for plantation in the project area. As a result, at present mangrove plants are found in the project area which changes canopy coverage in the project area and creates living environments of life.

**Figure 4.2: Water Sprayed and Green Belt at the Project site**

#### **4.1.3 Corporate Social Responsibility (CSR)**

The BIFPCL is committed to continue supporting/development activities under the CSR. It made a significant impact to the community in which community people get better interaction with the project. However, the CSR was the part of operation phase but it was observed that the BIFPCL committed to organize different programs, logistic and infrastructural support during the phase of construction.

The BIFPCL have conducting medical campaigns along with different socially demand-based programs. In consequence, they allocated vaccination program under the CSR in which officials and labor force got vaccinated. Also, constructed water treatment and filtering RO systems at 4 locations in Rajnagar and Gaurambha Unions for ensuring safe water for the community under the CSR activity. Previously, sewing and ICT training were introduced for the livelihood development of the local community in the study area.

##### *Traditional Cultural Program: Puppet Show and Drama*

Retrieving local traditional culture, a puppet shows and drama organized by UNO Rampal. This program was financed and coordinated by the MSTTP. The objective of this program is to aware people about the traditional culture. In this ground, this fund was allocated from CSR fund of MSTPP. Local people enjoyed and praised to continue this kind of activities (**Figure 4.3**).

##### *RO System Installation*

Four (4) RO system has been installed in the Rajnagar and Gaurambha Unions as 2 in each union where one in each union is operated successfully while remaining 2 are under process for operation. Each of these ROs are operated by a local committee formed by the guidance of respective union chairman.

**Figure 4.3: RO treatment and filtering system installation in the study area**

#### *Blanket Distribution*

About 5250 blankets were distributed to the destitute people of the study area as 10 unions of Rampal Upazila, 1 union of Mongla Upazila and 2 unions of Dacope Upazila. The program was implemented from 03 January to 08 January, 2022. Also, 750 blankets were distributed from the BIFPCL central office at Dhaka to the destitute people of Dhaka city.

**Figure 4.4: Blanket distribution in the study area**

#### *Wheel Chairs Distribution*

The BIFPCL authority arranged wheel chair distribution program for the disabled people in the study area. The program was held on 4<sup>th</sup> December, 2022 where 25 wheel chairs were distributed in Gaurambha and Rajnagar Unions.

**Figure 4.5: Wheel chair distribution in the study area**

### Victory Day Celebration

Victory Day of the country was celebrated through arranging cricket tournament among the officials of the BIFPCL and tree plantation program in the project area. Managing Director of BIFPCL chaired the program which was held on 16 December, 2021.

**Figure 4.6: Celebration of Victory day in 2021**

### Education Kit Distribution

School bags, umbrella and water pots were distributed among the 265 students of Gaurambha Adhaghat School in the study area under a program titled “School Bag, Panir Bottle Bitoron” which was also held on 16<sup>th</sup> December, 2021, the Victory Day of the country. The program was chaired by the Managing Director of BIFPCL.

**Figure 4.7: Distribution of education Kits**

### Medical Facilities

Medical campaign is one of the major programs under the CSR of MSTPP. From November, 2021 to January, 2022, a total of 2,207 people were freely treated under six types of medical facilities (OPD, mobile, boat, labor camp, laboratory tests and physiotherapy services) from the Niramoy medical center. Detail of the medical facilities provided over last three months are given in the following **Figure 4.8**.

Source: Niramoy medical center, February, 2022

**Figure 4.8: Medical Campaign from November, 2021 – January, 2022 under the CSR**

It is noted that a daylong medical campaign was initiated under the collaboration of Gazi Medical and MSTTP authority in the project area on 6<sup>th</sup> December, 2021 where free consultancy and medical services were provided to the local people

## 4.2 Recommendations

- a. Local work forces should be trained on masonry, carpentering, electrician & electronics, welding, driving, safety worker, rod binding and machineries operation to prepare them as the semi-skilled working force for this project;
- b. It is required to establish a grievance redress team to monitor and solve the problem (especially during selecting beneficiaries for providing any services from the MSTTP) of localities regarding the aspect of construction activities of MSTTP;
- c. A gender action plan regarding the women employment is required for the local communities;
- d. Previously sewing and computer training were introduced for the skill development of local people. Outcomes of those trainings should be monitored as a lesson learnt, before initiating further such types of training;
- e. Some ROs are installed in different location of the study area to ensure safe drinking water for the local people. Few of those are not properly operated due to malfunctioning of the Operational Local Committee. It is essential, to solve the issues immediately through discussion with those committees and related officials including LGIs representative;
- f. Regular plantation is to be continued for making the desired and committed greenery effectively as per conditions of DoE;
- g. Continuing regular health checkup and disease monitoring for the daily laborer at work place as well as for the laborer staying at labor colony;
- h. Close monitoring should be continued for maintaining Covid-19 protocol and for handling any syndrome related to the COVID 19;
- i. Ensure masks and other PPEs for everyone who are working at the Project site;
- j. All officials and workers should be included under the Covid-19 vaccination program and project authority should maintain record and close monitor the issue;

- k. CSR activities should be performed primarily among the PAPs on equitable manner. This should be audited by a third party monitoring team;
- l. Special attention should be taken care for assessing the needs to local schools and colleges for implementing different programs under the CSR;
- m. Local people are becoming aware about the new entrepreneurship development in this area; in this regard, training on entrepreneurship development should be arranged under the CSR activities;
- n. Rehabilitates should be given preference in implementing CSR program as they are under serious threat of another shifting;
- o. Dust suppression by spraying water should be continued on construction sites, and other places where necessary to suppress dust and minimize air pollution; Special monitoring team required to monitor the dust pollution;
- p. River water should be used for dust suppression activities and ground water use should be avoided completely;
- q. The PMU should be active and efficient in maintaining vehicle speed limits in the Project site;
- r. Mindset of local people have been changed and people are more positive about the project. To increase more awareness, it is required to arrange some consciousness program in which they can be more aware how this power plant will be operated and how this project will be beneficial for the local people;
- s. Digital Billboard about the MSTPP work progress status, and operation system would be placed on the approach road at main road connecting side to create more awareness about the construction and operation of the MSTPP.
- t. It is required to arrange program at local schools, colleges and UP offices about the operation and impact of the power plant to disseminate the progress of the project and create more awareness about the MSTPP.

## 5. Environmental Compliance

### 5.1 Introduction

This compliance report aims to highlight the potential for improving social and environmental compliance, including Occupational Safety and Health (OSH) issues in Bangladesh-India Friendship Power Company Ltd (BIFPC). Providing an operational translation of local laws, international standards and company codes, the report will demonstrate the actions required to ensure that all operations along the supply chain, from the production of the raw material to the production of the electricity that are consistent and comply with DoE conditions and also Environmental Management Plan (EMP) requirements stated in the EIA report.

An E&S team from CEGIS recently visited to the plant on 30<sup>th</sup> of January, 2022 to have a look and to acquire information intrinsically considering the bio-physical and other related parameters through a rigorous walk-in visit, meeting with plant officials, general labours and overall the close observation of the ongoing work at the plant.

During the visit we found an immense workforce is working relentlessly to wrap-up the remaining works despite a recent spike in coronavirus cases. Currently mechanical and electrical works are underway while Major civil works like boiler, turbine, cooling tower, chimney, FGD, township has already been finished mostly. Major ongoing Civil, mechanical and electrical works in this quarter are as follows:

- Mechanical and electrical works of Water Treatment Plant (WTP) is mostly done.
- Civil works of ETP plant is ongoing where the effluent will be further treated before final discharge.
- Structural works of Flue Gas Desulphurization Plant (FGD) is almost done which will use wet limestone, forced oxidation process and using double flow contract scrubber would extract 96% of the Sulphur from the coal.
- Closed system Conveyor belt to transport Coal from jetty to the coal shed inside the plant premises is under installation.
- Coal yard/shed is under construction. Structural work has already done but the shed cover is yet to be installed.
- Construction of ash silo is in progress.

Due to the consecutive lockdown for spreading Corona Virus across at India and in Bangladesh the construction progress was temporarily decelerated that hindered to meet the anticipated commencement date for commercial operation but the plant authority and Bangladesh Government are very optimistic of launching the commercial operation on March 26, 2022. To make it happen EPC contractor i.e. Bharat Heavy Electricals Limited (BHEL) employed different local specialized sub-contractor i.e. KELLER, AFCON, POWER MAC etc. who are working tirelessly to meet the targeted date of commissioning of the plant.

However, the present environmental compliance monitoring includes the status of EMP implementation based on physical observation, investigation and interviews/discussion to the proponents and project officials and the relevant authorities. A comprehensive due diligence checklist was prepared to monitor the environmental compliance of different components e.g. Environmental and Social Management System and Action Plan; Labor and Working Condition; Community Health, Safety and Security; Biodiversity and Sustainable Management of Living Natural Resources.

The aim of this compliance checklists is to check the implementation and effectiveness of mitigation measures as stated in EIA. The checklists are produced as Compliance Data Sheet that contains both quantitative and qualitative data. The summary of findings of the environmental compliance monitoring are presented in the following **Table no. 5.1, 5.2, 5.3 and 5.4** respectively.

**Table 5.1: Monitoring of Environmental and Social Management System Action Plan Implementation**

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
1	Water Quality	<ul style="list-style-type: none"> <li>• Surface water must be saved from any harmful effluent emission and waste dumping from project site</li> <li>• Provide closed system facilities and wastewater treatment plant to minimize discharge of effluents from worker's colony.</li> <li>• Good housekeeping at workshop and construction site</li> <li>• Appropriate equipment with safety measures should be used for storage and handling of lubricant</li> <li>• Provide training and awareness building program to the workers during construction. The training and awareness programs are:               <ol style="list-style-type: none"> <li>a) Arrange weekly consultation session among the workers through plant site managers. The duration of consultation is one hour according to ISO-14001 standard,</li> </ol> </li> </ul> <p>Arrange monthly environmental meeting among the mid-level officers through top management when those issues will be discussed under guidance of ECR 1997.</p>	<ul style="list-style-type: none"> <li>• Surface water is regularly monitored. The discharge water quality has been recorded within the standard limit (ECR, 1997)</li> <li>• Ground water is not used for construction purpose.</li> <li>• Construction waste water discharge is minimum and need based only. They are also meeting effluent norms.</li> <li>• Permanent drainage for waste water discharge under BHEL is still under construction.</li> <li>• Closed system wastewater treatment facility on site is near to finish. Mechanical and equipment installation work is underway.</li> <li>• Temporary chemical lab has established where turbidity, PH, alkalinity, conductivity, chlorine, iron (Fe) parameter are being tested and monitored (Picture attached)</li> <li>• RO1 and RO2 tank establishment has completed. Now the composite thin membrane is being installed to remove the dissolved solids (less than 400 TDS at RO1 and less than 10 TDS at RO2)</li> <li>• ETP plant is under construction where the effluent will be further treated before final discharge.</li> <li>• BIFPCL authority has established a silt trap at the North-East corner of the project site to control sediment running out from the projects with rainfall runoff.</li> <li>• the sediment discharge to the nearby river system</li> </ul>	Complied at present	<ul style="list-style-type: none"> <li>• Good housekeeping at workshop and construction site is strongly recommended</li> </ul>

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
			Training and awareness program staged regularly through PEP talks, lectures, one to one talk etc.		
2	Waste Generation	<ul style="list-style-type: none"> <li>Limiting site clearance and base stripping activities within the project boundary.</li> <li>Gathering and stocking of construction materials and machinery must be within a limited area in the project boundary.</li> <li>The project area has to be fenced prior to initiation of construction activities.</li> <li>Stock piles of construction materials requiring cover up in order to protect them from wind and weathering action.</li> <li>The existing right of way have to be used for material transportation without creating any block</li> <li>Location of spoil stock pile ought to be located in safe area and protected from wind and rain action.</li> <li>No spoil store on River bank/slope</li> <li>Construction wastes must be reused or recycled as and where possible</li> <li>Burning of waste material should be restricted</li> <li>Quality housekeeping practice must be maintained by regular inspection and checking.</li> <li>Keep onsite waste collection and disposal facilities</li> <li>Keep provision of different colored waste bin for dumping biodegradable, reusable and recyclable wastes.</li> </ul> <p>Keep provision of awareness building meeting and training for employees</p>	<ul style="list-style-type: none"> <li>During the visit CEGIS team found most of the construction waste are compiled at the demarcated place but more attention need to manage this properly as some waste were scattered here and there.</li> <li>The specific site for waste disposal were relatively kept clean.</li> <li>No chemical or gaseous waste noticed during the visit as Chemical wastes are properly stored and labelled</li> <li>Onsite waste collection and disposal facility has been observed.</li> <li>Source segregation method were absent and not kept in separate labelled container.</li> <li>Though there are 635 different colored waste containers but not labeled by Bengali or English written sticker that is very important for source segregation of the waste.</li> <li>Burning of waste materials is strictly banned inside the plant premises.</li> <li>BHEL has engaged a company name Rahman Brothers in collaboration with the KCC for collection of waste from the disposal.</li> <li>Waste management training has been included in induction training of the labor.</li> <li>Only mechanical work is now underway but high restriction on spoil storage on the river bank/ slope has been ensured</li> </ul>	Mostly Complied with some lacking	<ul style="list-style-type: none"> <li>Special care and training need to be conducted regarding source segregation of the waste</li> <li>Awareness raising programs regarding waste recycle and reuse should be introduced.</li> <li>Team advised to label the waste container in written by both Bengali and English so that one can easily understand which container is for which type of waste.</li> </ul>

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
3	Compensation and Resettlement	<ul style="list-style-type: none"> <li>• Proper resettlement action plan and compensation plan if the Project needs any land acquisition addressing compensation, restoration, livelihood, living standards etc. based on proper socio-economic studies.</li> <li>• Resettlement of the PAPs</li> <li>• Cash for compensation of land (CCL) before resettlement formal agreement with the affected people prior to migration/resettlement</li> <li>• Sufficient standing crop compensation</li> <li>• Compensation for movable structures</li> <li>• Retention of salvageable materials</li> <li>• Compensation for loss of trading income one-time moving assistance grant to cover loss of regular wage income</li> <li>• Has a resettlement plan been developed which includes compensation, restoration, livelihood, living standards etc. based on proper socio-economic studies?</li> <li>• Human provide/ take extra care/caution for the disadvantaged/ vulnerable group/s (i.e. women, children, ethnic minorities, indigenous people etc.)</li> </ul> <p>Provision of monitoring the compensation and resettlement process</p>	<ul style="list-style-type: none"> <li>• Compensation has been given to the rightful owners of the land as per the laws of Bangladesh e.g., 'Acquisition and Requisition of Immovable Property Ordinance, 1982 started in 2011</li> <li>• Compensation was paid by the local DC office as per law of the land.</li> <li>• Local DC office facilitates to obtain house of the PAPs (settlers of the project area) in cluster villages provided by the GoB.</li> <li>• Almost 32 affected families are now having their houses at Foyla cluster villages.</li> <li>• BIFPCL is giving priority to affected people in project employment or trained them as much possible.</li> <li>• A significant number of affected people (especially who deserve) are working at the construction site.</li> <li>• 136 indirectly affected people were given compensation by the DC Office, Bagerhat.</li> <li>• About one third of the labor has been recorded from the locals.</li> <li>• The project authority has given training on computer and swing to the nearby villagers including PAPs which is stopped at present due to COVID-19.</li> <li>• 17 families got their residence who have shifted their houses from project area to Kapashdanga.</li> </ul> <p>The project authority has developed plans to monitoring the resettled PAPs</p>	In the process of Compliance	<ul style="list-style-type: none"> <li>• The CSR activities should be oriented towards the affected people or household;</li> </ul> <p>CEGIS team advised to collect the original copy of compensation disbursement to the affected peoples from local DC office.</p>

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
4	Livelihood and living condition	<ul style="list-style-type: none"> <li>The labor recruitment policy must be formulated in such a way that the local laborers can easily get the chance of employment in the project work force.</li> <li>Govt./NGOs need to provide support the skill development program and income generation activities to local people;</li> <li>For the increased movement of people and heavy vehicles, the road networks must be developed.</li> </ul> <p>Keep provision of sanitary toilet, one toilet for 10 persons.</p>	<ul style="list-style-type: none"> <li>BIFPCL are recruiting the local people especially PAPs with the help of local government (UP Chairman and members).</li> <li>Accidental log sheet or injury log book are being maintained.</li> <li>Provisions has been kept for health facilities to the labors as well as for the communities.</li> <li>Proponent has taken numbers of potential measures for COVID protection which is continued</li> <li>The wage of the labor was found compatible with the national standard.</li> </ul> <p>Available drinking water, sanitation facilities, prayer room are provided at site.</p>	Complied	<ul style="list-style-type: none"> <li>1 toilet for 10 people should be ensured</li> </ul> <p>Health and financial support should be available for the labour in case of COVID and other health effects.</p>
5	Green House Gas Controlling Measures	<ul style="list-style-type: none"> <li>Restriction of any kind of solid waste disposal</li> <li>Approved pollution control devices to be fitted in equipment and machinery.</li> <li>Transport vehicles must not be overloaded.</li> <li>Avoid queuing of vehicles in areas adjacent to site, particularly near sensitive receptors including housing.</li> <li>Switch off / throttle down all site vehicles, water vessels, generator and machinery when not in use.</li> </ul> <p>Regular maintenance of water vessels, vehicles, generator and machinery in accordance with manufacturer's</p>	<ul style="list-style-type: none"> <li>Fitness certification of vehicles and equipment are lacking for the construction works</li> <li>The EPC Contractor is using relatively new equipment and vehicles to reduce the GHGs emission.</li> <li>Energy efficient goods like light, AC and other equipment are used.</li> <li>Equipment, generators and vehicles were observed switched off during non-operation period.</li> <li>Green waste is not being segregated from others that can be a major concern for GHG emission.</li> </ul> <p>No GHG inventories were prepared yet.</p>	Partially Complied	<ul style="list-style-type: none"> <li>GHGs inventory checklist should be prepared</li> <li>Team advised to label the waste container in written by both Bengali and English so that one can easily understand which container is for which type of waste.</li> </ul>
6	Water Quality	<ul style="list-style-type: none"> <li>Surface water must be saved from any harmful effluent emission and waste dumping from project site</li> </ul>	<ul style="list-style-type: none"> <li>Surface water is regularly monitored. The discharge water quality has been recorded within the standard limit (ECR, 1997)</li> <li>Ground water is not used for construction purpose.</li> </ul>	Complied at present	<ul style="list-style-type: none"> <li>Good housekeeping at workshop and construction site is strongly recommended</li> </ul>

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
		<ul style="list-style-type: none"> <li>• Provide closed system facilities and wastewater treatment plant to minimize discharge of effluents from worker's colony.</li> <li>• Good housekeeping at workshop and construction site</li> <li>• Appropriate equipment with safety measures should be used for storage and handling of lubricant</li> <li>• Provide training and awareness building program to the workers during construction. The training and awareness programs are:</li> <li>• Arrange weekly consultation session among the workers through plant site managers. The duration of consultation is one hour according to ISO-14001 standard, Arrange monthly environmental meeting among the mid-level officers through top management when those issues will be discussed under guidance of ECR 1997.</li> </ul>	<ul style="list-style-type: none"> <li>• Construction waste water discharge is minimum and need based only. Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
		<ul style="list-style-type: none"> <li>The project area has to be fenced prior to initiation of construction activities.</li> <li>Stock piles of construction materials requiring cover up in order to protect them from wind and weathering action.</li> <li>The existing right of way have to be used for material transportation without creating any block</li> <li>Location of spoil stock pile ought to be located in safe area and protected from wind and rain action.</li> <li>No spoil store on River bank/slope</li> <li>Construction wastes must be reused or recycled as and where possible</li> <li>Burning of waste material should be restricted</li> <li>Quality housekeeping practice must be maintained by regular inspection and checking.</li> <li>Keep onsite waste collection and disposal facilities</li> <li>Keep provision of different colored waste bin for dumping biodegradable, reusable and recyclable wastes.</li> </ul> <p>Keep provision of awareness building meeting and training for employees</p>	<ul style="list-style-type: none"> <li>The specific site for waste disposal were relatively kept clean.</li> <li>No chemical or gaseous waste noticed during the visit as Chemical wastes are properly stored and labelled</li> <li>Onsite waste collection and disposal facility has been observed.</li> <li>Source segregation method were absent and not kept in separate labelled container.</li> <li>Though there are 635 different colored waste containers but not labeled by Bengali or English written sticker that is very important for source segregation of the waste.</li> <li>Burning of waste materials is strictly banned inside the plant premises.</li> <li>BHEL has engaged a company name Rahman Brothers in collaboration with the KCC for collection of waste from the disposal.</li> <li>Waste management training has been included in induction training of the labor.</li> <li>Only mechanical work is now underway but high restriction on spoil storage on the river bank/ slope has been ensured</li> </ul>		<ul style="list-style-type: none"> <li>Awareness raising programs regarding waste recycle and reuse should be introduced.</li> <li>Team advised to label the waste container in written by both Bengali and English so that one can easily understand which container is for which type of waste.</li> </ul>

Table 5.2: Monitoring of Labor and Working Condition

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual measures already Implemented	Compliance Status	Recommended Action
1	Working Conditions and Management of Worker Relationship	<ul style="list-style-type: none"> <li>Preparation of Human Resources Policies and Procedures for Direct workers;</li> <li>Defined Working condition and Terms of Employment for direct worker;</li> <li>Sustainably equivalent terms and condition for migrant workers;</li> <li>Compliance to national law of forming workers' organization;</li> <li>No discrimination and equal opportunity for all;</li> </ul> Grievance Redress Mechanism.	<ul style="list-style-type: none"> <li>BIFPCL is running through the HR polices and switching their professionals as per demand of the project.</li> <li>Based on the conversation with HR manager we came to know all the agreement for the direct workers are well maintained.</li> <li>Electrocution/ firefighting facilities are properly maintained where required specially inside the building.</li> <li>Accidents, incidents, near miss, corrective actions, preventive measures, are reviewed and recorded.</li> <li>O2 level measurement and other precautionary measures followed properly if there is any work need to be done in a confined space or any other closed premises.</li> <li>The EHS department is also monitoring the occupational health safety issues carefully under this COVID situation.</li> <li>No discrimination was recorded among at labor level between local or migrating labor in Bangladesh</li> <li>BIFPCL has ensured minimum wage and working hours for the labor as per GoB rules and regulation.</li> <li>Routine medical checkup and emergency medical care has been ensured Continued in association with COVID management guideline.</li> </ul> GRM procedure is available for the project workers and officials but Community GRM is absent.	Partially Complied	<ul style="list-style-type: none"> <li>OHAS must be monitored for construction workers</li> <li>To develop labour association protecting labour interest</li> <li>Create fund to support the labour and his families in case of any fatalities</li> </ul> CEGIS team has strongly recommended to the authority to commence Community GRM. The grievance box may be fixed just at the outside of the main entrance.
2	Protecting Work Force	<ul style="list-style-type: none"> <li>The client will not employ children in any manner that is economically exploitative, or is</li> </ul>	<ul style="list-style-type: none"> <li>CEGIS tem visited all part of the construction area and pleased to see there is no child involved in the construction and any other works.</li> </ul>	Complied	<ul style="list-style-type: none"> <li>Complied but this should be continued</li> </ul>

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual measures already Implemented	Compliance Status	Recommended Action
		likely to be hazardous or to interfere with the child's education, or to be harmful to the child health or physical, mental, spiritual, moral, or social development. No Forced Labor	<ul style="list-style-type: none"> <li>No forced labor has been recorded in the project.</li> <li>Proper documentation of contract with the worker is being maintained which includes working hour, wage and benefit.</li> <li>Work in hot condition and height need another permission</li> <li>Awareness about Covid-19 is being monitored. Team observed the workers are maintaining a physical distancing as well as using the proper precaution against COVID-19.</li> <li>Workers must get the safety clearance before initiating any work like – routine checkup of the work places and administrative clearance is being Implemented</li> <li>Sanitization is being done at regular intervals at Offices and labor sheds</li> </ul> <p>First Aid support is readily available for the labors as required.</p>		<p>strictly till the end of the pandemic.</p> <p>Awareness work should be continued regarding the local cultural values, STD, redressing of workers grievances, insurance policy related facilities and also contract clauses of the job to get maximum benefit.</p>
3	Safety at site	<ul style="list-style-type: none"> <li>Installation/Construction of Safety Fence around the Project area</li> <li>Use of Personnel Protective Equipment's (i.e. safety vest, safety goggles, ear plug, safety shoes, gloves, dust mask, etc.);</li> <li>Safety trainings for workers (i.e. fire control, working at height, working in heat, first aid etc.);</li> <li>Practice of Tool box meeting, safety talks</li> <li>Safe Storage of Hazardous Chemicals (e.g. fuel, flammable chemical, toxic chemicals, etc.);</li> </ul>	<ul style="list-style-type: none"> <li>BIFPCL has demarcated the specific construction site with appropriate warning sign.</li> <li>It was impressive to see that all Labors and Project personnel are using appropriate PPEs like reflecting vest, helmet, and safety shoes and face masks.</li> <li>Fire extinguishers were found sufficient and well-functioning at required places. Workers get training from the fire service station and also achieve the certificate for the emergency firefighting.</li> <li>The OHAS Company named Cholamandalam has been looking into the occupational safety system of this project.</li> </ul>	Complied	Though we found the poster with emergency contact no at site but we commended to fix such type of poster as many as they can at the different places inside the project boundaries

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual measures already Implemented	Compliance Status	Recommended Action
		<ul style="list-style-type: none"> <li>• Maintaining Material Safety Data Sheet (MSDS);</li> <li>• Provision of Health care facilities such as doctor, hospital etc. available at/nearby the Plant construction site;</li> <li>• Availability of First Aid at work place;</li> <li>• Preparation and Follow of Emergency Response Plan (ERP);</li> <li>• Adequate fire precautions in place (e. g., fire extinguishers, escape routes etc.);</li> <li>• Documentation and reporting of occupational accidents, diseases, and incidents;</li> </ul> <p>Policies and procedures for managing and monitoring the performance of third-party employers in relation to OHS</p>	<ul style="list-style-type: none"> <li>• Medical checkup is mandatory for all employee before starting the work at the project site.</li> <li>• Weekly checking of all the safety records and implementation of HIRA at site.</li> <li>• Safety walk-down at a regular interval by the OHS officer has been strengthening the HIRA process.</li> <li>• Emergency contact address was found on the board at the site for any kind of sudden incident. This type of poster seems inadequate.</li> <li>• The existing temporary hospital are fully running with doctors and 24hr availability of ICU supporting ambulance at the Project site;</li> <li>• EPC has made a contract with the Gazi Medical of Khulna city for emergency medical support.</li> </ul> <p>During COVID situation all the necessary precautionary measures including physical distancing is maintained properly. Vaccination program was arranged and basic health checkup including body temperature is monitored at regular basis while enter into the working site.</p>		
4	Occupational Health and Safety procedure	<ul style="list-style-type: none"> <li>• Provision of complete EHS division in the Human Resources Planning/ Organogram</li> </ul> <p>Preparation of Safety Policy to be adopted during Plant operation</p>	<ul style="list-style-type: none"> <li>• Adequate number of safety officers have been employed by the EPC contractor and Sub-contractors.</li> <li>• The OHAS Company named <u><b>Cholamandalam</b></u> has been looking into the occupational safety system of this project.</li> <li>• One safety park has been established for continual training as well as training during induction level.</li> <li>• Zero major accident/ incident happened from 21<sup>st</sup> April 2021 till now except some minor injuries.</li> </ul>	Being Complied	<ul style="list-style-type: none"> <li>• OHS should be a Continuous process regarding awareness build-up and strict to the safety issues,</li> <li>• Continued the safety training, buildup the awareness and make the labour habituated with the safety procedure</li> </ul>

Sl. No.	Potential Impacts	EMP measures as proposed in the EIA	Actual measures already Implemented	Compliance Status	Recommended Action
			<ul style="list-style-type: none"> <li>Total Recordable Injury Frequency Rate (TRIFR) and Lost Time Injury Frequency Rate (LTIFR) are being followed.</li> <li>Medical aid, fire extinguishers, PPEs are being provided adequately.</li> <li>Regular Safety talk, safety meetings are being organized at site and also in class rooms. Photo are being attached.</li> </ul> <p>Adequate safety bill-boards etc. have been displaced all over the construction area.</p>		
5	Workers Well Being	<ul style="list-style-type: none"> <li>Provision of Welfare facilities for Worker/Labor such as, timely bonuses, wage, overtime, sick leaves, vacations etc.;</li> <li>Routine medical check-up and emergency medical care for the sick and injured;</li> </ul> <p>Appointment of a leader amongst the labor group, who will look into workers' well- being.</p>	<ul style="list-style-type: none"> <li>Workers are satisfied with the residence facilities provided by BIFPCL. No dissatisfaction among the workers observed.</li> <li>BIFPCL has developed apps <a href="https://bifpcl.com/safety.aspx">https://bifpcl.com/safety.aspx</a> for stepping up the safety issues well.</li> <li>BIFPCL has ensured the benevolent grant developed by the contractor for the victim's family as per Government' rule.</li> <li>Basic amenities like food, medicines, hygiene etc. are being ensured in labor colony</li> <li>Workers get lemon or water during work period</li> <li>Basic Medical care with free medicine and counseling is being provided to workers on regular basis.</li> <li>Vitamin-C rich fruits, ORS distribution being done to contract workers occasionally.</li> <li>Grievance mechanism available for the workers that usually address the safety issues.</li> <li>No labour association identified yet to look after workers 'well-being issues</li> </ul>	Mostly Complied	<ul style="list-style-type: none"> <li>Establish and Freedom of Association, Rights &amp; scope of bargaining should be open for the workers.</li> </ul> <p>Take care about the ultimate payment of the labors from the sub-contractor or local contractor. It should not be lower than the national standard fixed by the PWD for the labors.</p>

Table 5.3: Monitoring of Community Health, Safety and Security

Sl. No	Potential Impacts	Proposed EMP	Actual measures already Implemented	Compliance Status	Recommended Action
1	Disturbance to nearby community due to dust from developed land and Noise from construction activities	<ul style="list-style-type: none"> <li>Construction of boundary wall around the Project area;</li> <li>Installed water spraying system to control dusts;</li> <li>Conducting dust monitoring and visual inspection around the site boundary;</li> </ul> Adopted noise management plan.	<ul style="list-style-type: none"> <li>Boundary wall construction is almost completed except some part in the North-eastern part around the project area.</li> <li>Continuous water sprinkling on the dusty road was noticed at a regular interval at the project premises by 3 water tankers. BHEL has contracted with an external company for 3 years for doing this job to suppress fugitive dust.</li> <li>Water is also being sprayed regularly on the stockpiles and registered.</li> <li>Environmental Monitoring team from CEGIS is routinely communicating with the nearby communities for assessing impacts and related complaints on dust generation issue.</li> <li>Regular communication and consultation are taken places with the local government and local administration officials except this COVID situation</li> <li>CEGIS team regularly monitors the noise level in the ambient area of the project site like Bajua, Mongla, koigordashkathi and it meets the standard noise level.</li> </ul> Community GRM system was absent that is considered as an important tool to identify communities' complain	Partially complied	<ul style="list-style-type: none"> <li>Any complaint regarding noise and dust from local people must be addressed immediately and recorded accordingly in the register.</li> </ul> The grievance register should be placed at the gate of MSTPP so that the communities could easily raise their issues on this ground.
2	Grievance of local people	<ul style="list-style-type: none"> <li>Availability and operation of Grievance Redress Mechanism; Maintaining open communication channel with the local community.</li> </ul>	<ul style="list-style-type: none"> <li>Social liaison officer is working for maintaining relation with local communities especially the CSR activities.</li> <li>BIFPCL regularly display the progress of the development through their website (<a href="https://www.bifpcl.com/">https://www.bifpcl.com/</a>) and disclosure meeting at the local government</li> </ul>	Partially complied	Recommended to Put the grievance receiving box at outside the project boundary or at the project entrance gate so that the local community could

Sl. No	Potential Impacts	Proposed EMP	Actual measures already Implemented	Compliance Status	Recommended Action
			Though BIFPCL is receiving grievance from local community through local government like Union Chairman or Local Administration Community Grievance Redress Mechanism (CGRM) has yet to be in action. It should be started as soon as possible.		easily state any grievance properly.
3	Risk of breaching Community Safety	<ul style="list-style-type: none"> <li>Construction of boundary wall/safety fence around the Project area;</li> <li>Practicing Risk Assessment and Evaluation Process;</li> <li>Practicing safe management for hazardous materials which may pose threat to the community;</li> <li>Availability and operation of Emergency Response Plan;</li> <li>Maintaining open communication channel with the local community;</li> <li>Training and instruction to the security personnel about their behavior and communication with the local people;</li> </ul> <p>Aware the security personnel about the right of the community people.</p>	<ul style="list-style-type: none"> <li>Implement numbers of pollution mitigating system for protecting the dust and other pollution outside to the project area.</li> <li>Strictly prohibited to enter outsider to the project site or labor camp and if required entry pass is required to enter the project site area.</li> <li>Health check-up is mandatory to every labor during the induction training on which they get pass for work.</li> <li>No conflict has been noticed between local communities and project authorities or workers.</li> <li>Project Security personnel is well trained and instructed by the authority to demonstrate a decent behavior and attitude to the local communities.</li> <li>Maintaining communication with local community regarding their grievance about the worker and work facilities.</li> <li>Routine medical camp has been conducted each month.</li> </ul> <p>Distribution of essential food items, soaps to nearby villages and contract workers was done.</p>	Complied	<ul style="list-style-type: none"> <li>Maintain social distancing with the communities during this COVID situation</li> </ul> <p>Keep on tack about the communicable diseases transmission between the labors and nearby communities</p>
4	Community Health and Risk	<ul style="list-style-type: none"> <li>Provision of providing health service facilities to community if the Project poses any health risk like sexually transmitted</li> </ul>	<ul style="list-style-type: none"> <li>Continued the medical facilities (consisting medical officer, medical assistant, office assistant) at Plant site for checkup the communicable diseases of the workers and staffs;</li> </ul>	Being Complied	BIFPCL may introduce awareness program for STD and other transmitted diseases from workers to the community.

Sl. No	Potential Impacts	Proposed EMP	Actual measures already Implemented	Compliance Status	Recommended Action
		disease, contract disease, vector-borne diseases; Implement all pollution mitigation measures to ensure safeguarding to community.	<ul style="list-style-type: none"> <li>• Distribution of essential food items, soaps to nearby villages and contract workers during this COVID situation</li> <li>• BIFPCL is going to arrange again the weekly health service program (medical consultation and free medicine) for the local community considering the COVID situation.</li> <li>• Medical facilities for the local people has been running amid the COVID situation</li> <li>• Local people are coming to the office medical center for health issues where they are supported with health check-up and common medicine.</li> </ul> <p>EPC contractor is educating to the labors about protective action taken to avoid vector borne diseases and HIV positives and COVID pandemic</p>		
5	Youth Employment (Local)	Providing training/awareness program for the local youth to let them aware about the required qualification to get involved in the Project related activities Emphasis to recruit local labors according to their skills and capacities.	<ul style="list-style-type: none"> <li>• Regular communication is being maintained with the local government and community representatives for labor recruitment;</li> </ul> <p>The proponent took a number of initiatives to encourage local students through awarding them scholarships before the COVID situation. They will work again on this field after reducing the COVID cases significantly.</p>	Being Complied	Training related to skilled construction work i.e. masonry, rod binding, plumbing, carpenter, electrician, lineman, elevator mechanic, glazier, iron worker, driving, heavy equipment operator or laborer etc. should be introduced immediately;
6	Public Communication, Consultation and Awareness	<ul style="list-style-type: none"> <li>• Arranging public communication/consultation meeting;</li> <li>• Sharing of Project information with local people;</li> </ul> <p>Organizing environmental and social awareness programs/meetings.</p>	<ul style="list-style-type: none"> <li>• One social liaison officer is working continuously for developing relation with local communities.</li> <li>• Regular consultation meetings are carried out with the local government and administration.</li> <li>• Environmental and social awareness programs are organized and conducted by</li> </ul>	Mostly Complied	<ul style="list-style-type: none"> <li>• BIFPCL may use print media, social media, digital media might be used for spreading the project right information</li> </ul> <p>The proponent should aware and clarify about the</p>

Sl. No	Potential Impacts	Proposed EMP	Actual measures already Implemented	Compliance Status	Recommended Action
			<p>proponent on a regular basis except during the COVID situation.</p> <ul style="list-style-type: none"> <li>BIFPCL regularly display the progress (thru Video) of the development through their website (<a href="https://www.bifpcl.com/">https://www.bifpcl.com/</a>) and also disclosure meeting at the local government.</li> <li>The local people are aware regarding the project activities from multiple sources like consultation, display board, website etc.</li> </ul>		project the local people to stopover any rumor.

Table 5.4: Monitoring of Biodiversity and Sustainable Management of Living Natural Resources

Sl No	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
1	Rainfall runoff from the construction site would cause deterioration of aquatic ecosystem.	<ul style="list-style-type: none"> <li>Installation of proper runoff drains;</li> <li>Use of sediment fences, traps and basins for trapping the sediment, if required.</li> </ul>	<ul style="list-style-type: none"> <li>Permanent drainage system (Under BHEL) to discharge waste water from the project area is still under construction.</li> <li>The connectivity of Maidara River is being maintained.</li> <li>EPC Contractor is monitoring the water quality on monthly basis at every outlet of the project site and comply with the ECR 1997 standard</li> <li>Solid waste has been managed by third parties and finally disposed to the KCC disposal areas</li> <li>Construction waste water discharge is minimum and need based only which are also meeting effluent norms.</li> <li>The same is being discharged through north-east corner of the project &amp; also monitored regularly.</li> </ul> <p>Runoff/ wash away of the sediment is comparatively low to zero during this dry season.</p>	Being complied	<ul style="list-style-type: none"> <li>Take immediate measures to maintain the roads and basin for trapping the sediment before starting the heavy rainfall in the upcoming monsoon season</li> <li>BHEL need to complete their drainage facilities for the better waste water management.</li> </ul>
2	Disturbance to nearby ecosystem due to	<ul style="list-style-type: none"> <li>No cutting/ felling of trees along the river bank;</li> </ul>	<ul style="list-style-type: none"> <li>Most of the civil works has already completed. Now only the mechanical (instrumental and</li> </ul>	Being Complied	<ul style="list-style-type: none"> <li>Regular monitoring of the planted trees.</li> </ul>

Sl No	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
	different construction activities	<ul style="list-style-type: none"> <li>• Implementation of onsite waste and air quality management plan;</li> <li>• Limiting soil extraction activities within the defined area;</li> <li>• Limiting the vegetation clearance and base stripping process within the Project boundary;</li> <li>• Safety fence around the construction site;</li> <li>• Limiting the use of night light;</li> <li>• Using shade (directed downwards) around the outdoor lights;</li> <li>• Provision of cut-off time to switch off unnecessary lights at night;</li> <li>• Initiate Green plantation;</li> <li>• No plantation of non-native species;</li> <li>• Retaining top soil for future habitat restoration;</li> </ul> <p>No degradation of sensitive habitat.</p>	<p>machine fitting) and electrical works are under-way. Thus the risk of deforestation and disturbance to the nearby ecosystem are minimal in this quarter.</p> <ul style="list-style-type: none"> <li>• Under the afforestation program by BFD another 30,000 to 50,000 trees plantation will be finished by next April to May, 2022.</li> </ul> <p><b>Previous actions:</b></p> <ul style="list-style-type: none"> <li>• Main project activities (Construction and erection) are limited within the project boundary though some of the project activities (Gathering of stockpiles, concrete mixing activities) are being conducted in the south western side of the project and near bank of the Passur River (Jetty construction).</li> <li>• Limiting the vegetation clearance within the Project boundary especially around the ash impoundment.</li> <li>• An MoU signed with Forest Dept., Bangladesh on 24.02.2015 for implementation of Afforestation Program. Initial target was to plant 2 lac saplings in 3 years. Later another fresh Agreement with BFD was signed on 24.01.2018 for plantation of 5 Lakh trees for at the end of construction stages.</li> <li>• Under these plantation program initiated by Bangladesh Forest Department (BFD) about 80,000 trees of fruits and medicinal species has already planted.</li> <li>• They are maintaining the EMP for protecting the adjacent ecosystem</li> <li>• No alien species has been recorded</li> </ul>		<ul style="list-style-type: none"> <li>• Reduce the rate of mortality at the sapling stages.</li> </ul>

Sl No	Potential Impacts	EMP measures as proposed in the EIA	Actual condition/ Measures already Implemented	Compliance Status	Recommended Action
			<ul style="list-style-type: none"> <li>Wild species like avifauna and mammals are now recorded in the greenery areas of the project site</li> <li>Employees are aware about the rescues of species and no harm to wild species</li> </ul>		
3	Disturbance to river, inter-tidal areas and wet lands	<ul style="list-style-type: none"> <li>No encroachment of inter-tidal flood plain area;</li> <li>No disturbance to Dolphin community;</li> <li>Monitoring of Ecosystem Health and Monitoring of Sundarbans Forest Health;</li> <li>If required, embankment should be constructed considering a setback distance from river/canal bank;</li> <li>Slope protection work along the Maidara River should be completed on an urgent basis before rainy season come, and;</li> <li>BIFPCL may take initiatives of excavating of silted reach of Maidara river near proposed township area to facilitate proper functioning of River for maintaining tidal flow dynamics</li> </ul>	<ul style="list-style-type: none"> <li>Monitoring of ecosystem health of Sundarbans, and around the Project site is being continued.</li> <li>The project is not obstructing the surface water flow.</li> <li>BIFPCL has started maintenance of the slop protection works</li> <li>Bank protection works of western bank of Maidhara river is finished</li> <li>EPC Contractor is monitoring the discharged water quality at each of the outlet from this project on a monthly basis.</li> <li>The project authority has constructed the permanent jetty as per approved layout.</li> <li>The Maidara River is showing its natural phenomena.</li> <li>Selected coal suppliers ensured the appropriate vessels with minimum sound for the coal transportation to avoid the disturbance to Dolphin community.</li> </ul>	Complied	<ul style="list-style-type: none"> <li>Initiatives should be taken for excavation of silted reach of Maidara River to protect the rainfall runoff washout.</li> </ul>

Table 5.5: Status of Compliance to the Conditions of DoE

Sl. No	Condition of DoE	Compliance Status	Remarks
1	This EIA Report is approved only for 1320 MW Khulna Coal Based Power Plant. Any expansion or extension of this Power Plant will require obtaining further Environmental Clearance with additional EIA Study.	BIFPCL has not yet initiated any plan for expansion or extension of the 2x660 MW Maitree Super Thermal Power Plant.	BIFPCL will comply with the condition prior to initiation of any expansion or extension of the Power Plant.
2	The Coal Specification and Power Plant technology should be maintained as per EIA report. In case any change in design the proponent must obtain consent from DoE.	The Coal Specification and Power Plant technology are being maintained as per EIA report so far. In case of any change in Plant design and coal specification, the proponent shall have to obtain early consent from DoE.	Suggested to comply as and when required.
3	Project Proponent may undertake activities for land development and infrastructural development of the Project.	BIFPCL has already completed land development and Infrastructure development activities mostly for the Block-A area. Now the mechanical and electrical works are in progress.	Being Complied.
4	Project Proponent may open L/C (Letter of Credit) for importing machineries for the Project, which shall also include machineries relating to waste treatment plant and other pollution control devices.	The appointed EPC contractor has already imported maximum Equipment & machineries relating to waste treatment plant and other pollution control devices through opening the L/C.	Being Complied.
5	The activity under Proposed Khulna 1320 MW Coal based Thermal Power Plant Construction and operation shall not release any pollutant that affect human health or will have damaging impact on the environment or natural resources.	BIFPCL engaged CEGIS as an independent entity for monitoring the construction activities for examining environmental impacts on quarterly basis before the construction works started and accordingly the environmental and social impacts are being monitored as per EMP since 2014. No significant impact of Power Plant activities on the surrounding environment or on the natural resources has been recorded and reported (by the community) yet. Moreover, to control the emission and pollution an Effluent Treatment Plant, ESP, and FGD etc. have already been incorporated in the technical specification of main Plant as per DoE stipulations. During the visit to prepare 31 <sup>st</sup> quarterly monitoring report we found the construction and structural work of FGD and ESP has almost finished except the electrical and mechanical works are underway. Civil works of ETP is running in a full swing and expected to finish by next quarter. Moreover, environmental compliance monitoring is also being continued in the project site in order to assess the impact on project ambient air quality, discharge water quality and noise level around the project site, working and labor conditions, occupational	Being Complied.

Sl. No	Condition of DoE	Compliance Status	Remarks
		safety procedures community grievances etc. as per the monitoring plan stated in the EIA.	
6	Proper and adequate mitigation measures shall be ensured throughout preparation, construction and operation period of the proposed Khulna 1320 MW Coal based Thermal Power Plant Project activities.	BIFPCL has taken appropriate mitigation measures conforming EMP and technical specification of main Plant at each of the stages of Project Development.	Being Complied.
7	Any heritage sight, ecologically critical area, and other environmentally, religious and archaeologically sensitive places shall be kept protected during Project construction phase.	There is no Religious and Archaeological place in and around the Project site. As a third party, CEGIS is continuously monitoring the potential locations and indicators which are sensitive to coal transportation in the Sundarbans ECA, Sundarbans Reserve Forest and Sundarbans World Heritage Site as per the guidance of DOE and Bangladesh Forest Department (BFD).	Being Complied and suggested to continue this compliance till and during the operation stage.
8	Environment friendly construction and development practices shall be followed that minimize loss of habitats and fish breeding, feeding & nursery sites.	All the construction activities along with the coal transportation system will be followed through best practices and according to the EMPs of EIA Report. Since, the environmental monitoring survey are not observed any anomalies, it can be concluded that the construction work is progressing in environment friendly procedure yet now.	Being Complied.
9	Construction works shall be restricted to daytime hours so as to avoid/mitigate the disturbance of local lives as well as implementation schedules of the works shall be notified in advance to nearby residents.	Construction related activities are restricted to daytime and sometimes extends to the late evening. The community responses towards construction works of Power Plant are being monitored and recorded regularly. Moreover, BIFPCL has appointed one social liaison officer who is working (24x7) for developing relation with local communities. Regular consultation meetings are carried out with the local government and administration in order to receive and realize the grievances and accordingly to redress those. There are no grievances related to the noise effects registered yet from the nearby communities.	Being Complied.
10	Proper and adequate sanitation facilities shall be ensured in labor camps throughout the proposed Project period.	EPC contractor and sub-contractor are providing adequate sanitation facilities for the workers. Sanitation facilities for health safety from COVID are supplied by the Contractor at the labor camps as well as in the work areas.	Being Complied
11	In order to control noise pollution, vehicles & equipment shall undergo regular maintenance; working during sensitive hours and locating machinery close to sensitive receptor shall be avoided.	All vehicle & equipment used at site are under regular maintenance and registration process. Working during sensitive hours like night time and locating machinery close to sensitive receptor like near the labor camps are being avoided or managed through appropriate measures as observed during the monitoring span.	Being Complied
12	No solid waste can be burnt in the Project area. An environment friendly solid waste management	Burning of waste materials is strictly prohibited inside the project boundary. BHEL has engaged a solid waste management company who is now collecting the solid	Being complied

Sl. No	Condition of DoE	Compliance Status	Remarks
	should be in place during the whole period of the Project in the field.	waste from the project area and dump it to the Khulna City Corporation (KCC) designated places. Development of environment friendly waste collection and disposal system like Solid Waste Management, STP etc. are being developed at the demarcated place in plant premises. In addition, waste management training has been included in induction training of the labor.	
13	Proper and adequate on-site precautionary measures and safety measures shall be ensured so that no habitat of any flora and fauna would be endangered or destructed.	Quarterly monitoring activities are being carried out to examine the potential impacts on habitat of flora and fauna. No significant changes are yet recorded. Moreover, monthly environmental monitoring has been performed for noticing any harmful air pollutant emission or waste discharge from the project area.	Being Complied
14	All the required mitigation measures suggested in the EIA report along with the emergency response plan are to be strictly implemented and kept operative / functioning on a continuous basis.	<p>The proponent is giving top priorities to occupational health and safety issues. To keep the workers and the plant safe, plenty of precautionary measures has identified during the physical visit of the plant.</p> <ul style="list-style-type: none"> <li>• An ICU rich hospital with an experienced medical team and ambulance has kept ready to provide the instant services</li> <li>• In case of emergency situation for both BIFPCL and EPC contractor, a contract has been signed with a private hospital (GAZI medical, Khulna) for medical services.</li> <li>• Emergency fire exit, the fire extinguisher, fire alarm has observed available and well-functioning.</li> <li>• As a part of emergency response plan emergency contact numbers contained laminated poster has noticed beside the construction site.</li> </ul> <p>BIFPCL working hard to build awareness about Covid-19 among workers and office support staff. Thermal scanning of workers is being done at regular frequency for checking COVID symptom.</p>	Being Complied
15	To control dust, spraying of water over the earthen materials should be carried out from time to time.	Periodic air quality monitoring in and around the project sites is being conducted and checked it with ECR, 2005 standard. Monthly air quality monitoring at three locations inside the project boundary are being carried out. Based on the air quality monitoring findings and seasonal aspects, site specific water spraying is scheduled. BHEL has contracted with an external company for three years (renewable) who are spraying water as per schedule by three (03) water tankers to suppress fugitive dust.	Being Complied
16	Storage area for soils and other construction materials shall be carefully selected to avoid disturbance of the natural drainage.	BIFPCL authority has selected designated areas for safe storage of construction materials. In addition, the maximum stock piles are sprinkling. They have established a silt trap at the North-east corner of the project site to control sediment running out from the projects with rainfall runoff.	Being Complied

Sl. No	Condition of DoE	Compliance Status	Remarks
17	Adequate considerations should be given to facilitate drainage system for runoff water from rain/tidal surge.	Adequate attempt has been adopted to facilitate drainage system for runoff water from rain/tidal surge as BIFPCL has already constructed the permanent drainage system for discharging water from the project area. Construction of permanent drainage system under BHEL scope of work is still behind	Being Complied.
18	Adequate facilities should be ensured for silt trap to avoid clogging of drain/canal/water bodies	Silt trap has been developed at the north-east corner of the project site. It is used to depositing the sediments coming with the storm water and finally discharge relatively sediment free storm water through the drainage line.	Being Complied.
19	The entire coal handling system should be designed as an enclosed (and not only covered) conveyor system. There should be integrated dust control system with dust extraction and bag filters at unloading areas and at each transfer points on the conveyor system.	Entire coal handling system is designed and constructed as an enclosed conveyor system as per DoE requirement. Integrated dust control system with dust extraction system/bag filter and dust suppression system at crusher house, unloading points, transfer points has been specified in the technical specification of Main Plant EPC contract package. Refer Section (V), B4 of Technical Specification. During the field visit by CEGIS team it is observed the installation of the closed system coal conveyor belt from jetty to the coal shed is under-way.	Compliance action initiated.
20	Coal Plant should have high-efficiency bag filter for arresting dust emissions.	Integrated dust control system with dust extraction system/bag filter and dust suppression system at crusher house, unloading points, transfer points has been specified in the technical specification of EPC contract. Refer Section (V), B4 of Technical Specification (Clause no B4.3.1.4). High-efficient ESP is now at construction stage.	Compliance action initiated.
21	Coal should be stored in a covered storage yard.	All these stipulations have been included in the technical specification of Main Plant EPC contract package, Section (V), B4 of Technical Specification (Clause No B4.3.1.6). The covered coal shed construction is at finishing stage.	Being complied
22	The entire coal stockyard should be covered with water sprinkler provided with automated moisture sensor to control self-combustion.	All these stipulations have been included in the technical specification of Main Plant EPC contract package, Section V, B4 of Technical Specification. The covered Coal stockyard is now at the final stages of finish.	Being complied
23	100% utilization of fly ash and bottom ash should be planned and implemented throughout the operation of the Plant. There should only be a provision of small ash dyke that will not exceed 25 (twenty-five) acres of land to store residual ash.	100% utilization of fly ash has been planned and shall be implemented throughout the operation of this Plant. EOI has been received in this regard from nearby Cement Industries. 25 acres' area has been allocated to store residual ash in case of emergencies. The ash dyke is now under construction stage.	Compliance action initiated.

Sl. No	Condition of DoE	Compliance Status	Remarks
24	Integrated dry ash handling, loading, unloading and transportation system should be established.	Integrated dry ash handling, loading, unloading and transportation system will be established during the operation stage of the power plant. Provisions in line with this has been included in Technical Specification of main Plant EPC contract package (Section V, Chapter B4). Ash silo is constructing beside the jetties in order to transport the dry ash with ships/cargo.	Compliance action initiated.
25	There should be adequate and properly sized and designed dry ash silo with appropriate conveyor system.	Adequate and properly sized dry ash silo with appropriate conveying system have been specified in Technical Specification of main Plant EPC contract package (Section V, Chapter B4). The construction work is progressing fast near the jetty.	Compliance action continued
26	Bottom ash should be extracted, crashed and stored in silos for utilization with proper collection and conveyor system.	Bottom ash shall be extracted, crushed and stored in silos for utilization with proper collection and conveying system during the operation stage of the power plant. The procedures have been included in the technical Specification of EPC contract package. (Section V, Chapter B4). The construction silo is almost finished.	Compliance action initiated
27	Resettlement and rehabilitation of the displaced population (including those who do not own land) should be done properly.	Land has been acquired as per the legal procedure of GoB. However, BPDB wrote to Ministry for suitable resettlement and rehabilitation as per DoE requirement. BPDB prepared an assessment (Livelihood Restoration Plan) regarding the rehabilitees (including those who do not own land) for this Power Plant. As per the recommendation of the LRP, a NGO "Samahar" completed Their tasks. This monitoring has recorded that DC office has rehabilitated around 32 families at Foyla and 17 families at Koigardaskati.	Compliance action continued
28	Resettlement plan should be properly implemented and people should be adequately compensated.	Resettlement and rehabilitation action had been taken as per the law of the land, Bangladesh. However, BPDB conducted an assessment (Livelihood Restoration Plan) regarding the rehabilitees (including those who do not own land) for this Power Plant. Based on the recommendation of the LRP, local NGO conducted the training and other tasks to the PAPs. DC office is trying to resettle the PAPs at their selected sites according to the LRP.	Compliance action continued
29	Construction material should be properly disposed-off after construction work is over.	Most of the civil works has already finished and now the mechanical and electrical works are going at full phase. During the field visit we found all the mechanical and construction residual are being kept at demarcated places. For the solid waste management, BHEL has engaged a company named Rahman & brothers in association with Khulna City Corporation (KCC) for collecting and safe disposal of waste materials form site.  Further development of environment friendly waste collection and disposal system like Solid Waste Management, STP etc. are being developed at the demarcated place in plant premises.	Compliance action initiated

Sl. No	Condition of DoE	Compliance Status	Remarks
		There is a provision of development of solid waste management system which is given at clause no B12 ,Part no 9 of book no -2 ,page no 147-161.In which there is development of WMC which has waste collection ,waste segregation at source, recycling ,treatment and disposal of waste will be done	
30	As described in the report environmental monitoring should be strictly followed and monitoring report should be shared with DoE to ensure the environmental management properly.	BIFPCL has engaged CEGIS as a third party independent entity for conducting environmental monitoring on a quarterly basis in February 2014. Accordingly, each quarterly monitoring report has been prepared, submitted and shared with DoE, which are also available at BIFPCL web site.	Being Complied.
31	All activities (pre-construction, construction and post-construction stage) should be implemented according to EMP clearly listed in the EIA report.	BIFPCL has adopted the EMP suggestions applicable at construction stages. BIFPCL is taking appropriate actions based on EMP monitoring report. BIFPCL regularly updates the EMP and OHAS which assist to reduce the risk of accidental events further. From the preconstruction stage till now BIFPCL has been following the guideline of EMP listed in the EIA report and we have suggested to follow the EMP strictly for the rest of the work.	Being Complied
32	A third party/independent monitoring bodies excluding JVC/BPDB should be engaged immediately for monitoring of all activities during pre-construction, construction and operation phases as per monitoring plan of EIA report and monitoring report must be submitted to Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment simultaneously.	CEGIS has been engaged by BIFPCL as an independent monitoring entity for conducting environmental monitoring on a quarterly basis since February 2014. Since the contract, CEGIS has been conducting the monitoring programs quarterly and producing monitoring reports on quarterly basis which are submitted by CEGIS to BIFPCL for onward submission to the Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment as directed by DoE.	Being Complied
33	Regular monitoring of the susceptible places of Sundarbans for protecting ecosystem, biodiversity and forest coverage should be made using latest high-resolution image for keeping ambient environment.	The Monitoring activities of CEGIS includes monitoring of the susceptible places of Sundarbans. The monitoring report contains analysis of biodiversity and forest coverage. However, in addition to this, Forest Department has also suggested some survey & analysis which have also been monitored and reported by CEGIS through the quarterly monitoring report.	Being Complied.
34	Air, water, soil, biological and social data should be monitored regularly with a network monitoring system with a view to assess the natural quality of the Sundarbans and other fragile ecosystem and report of monitoring results should be submitted to Bagerhat District Office, Khulna Divisional	The network monitoring system will be installed as a part of the project construction and it will be run as online monitoring system during the operation of the Power Plant.  All these stipulations have been included in the technical specification of Main Plant EPC contract package. (Section-V, Clause No B0 6.19.13.2 and Clause No. B0 6.19.13.5). However, air, water, soil and biological components are regularly	Compliance action initiated.

Sl. No	Condition of DoE	Compliance Status	Remarks
	Office and Headquarters of the Department of Environment simultaneously.	monitored as per recommendation of EMP. Each of the monitored environmental data has been incorporated in the Monitoring report and displayed on the BIFPCL website at present.	
35	There should be regularly disclosure of the report through workshops and websites and responses should be taken care accordingly.	CEGIS has been regularly carrying out public consultation at different levels. All the monitoring reports are being kept available on website of BIFPCL ( <a href="http://www.bifpcl.com">www.bifpcl.com</a> )	Being Complied.
36	Online air and water quality monitoring system should be made functional throughout the life of the Plant.	The online monitoring system will be installed when the Plant will be in operation phase. This will be continued throughout the life time of the Power Plant.  All these stipulations have been included in the technical specification of Main Plant EPC contract package. (Section-V, Clause No B0 6.19.13.2 and Clause No. B0 6.19.13.5).	Compliance action initiated
37	Management Information System (MIS) is to be developed for this coal-based Power Plant. The scope of MIS services will obviously include representing the real time monitored data especially environmental parameters displaying at Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment, BPDB and other concerned agencies/Ministries. The MIS should be web based for accessing every individual to show the real time monitored records.	The MIS will be prepared before commissioning of the Power Plant. For developing MIS, consultant will be engaged earlier. Specifications of MIS system is already included in EPC contract document. Technical Specification like DDCMIS, DDCS, PADO System, HART system, Plant MMS, Information management security system etc. have been included. Moreover, the EPC contractor is going to initiate this activity.	Compliance action initiated
38	JVC should provide all sort of logistics support to DoE and other relevant agencies for monitoring environment related items/events.	BIFPCL is ready to provide all sort of logistic support as and when required by DoE and other relevant agencies for monitoring of Plant construction activities and environmental items/events maintain the health and safety protocol of the construction site.	Being complied
39	No ground water should be allowed to use for plant purposes.	The Power Plant has been designed considering use of surface water only during all stages of project development and operation.  The authority has already installed Reverse Osmosis (RO) Water Treatment Plant (ABM Water) for use ground water for potable and domestic purposes. A second unit of RO plant is now in operation fulfilling fresh water from both domestic and construction requirements.	Ground water is being withdrawn only for supplying the drinking water.

Sl. No	Condition of DoE	Compliance Status	Remarks
		However, a 1200ft deep tube well has been recorded near the ABM water plant for backup during emergencies. Proponent informed that some time it is used to supply the drinking water.	
40	Conduct stakeholder meetings on regular basis for better performance of the Project as a whole.	BIFPCL has appointed a social liaison officers who regularly visits nearby community to consult with the local people. Besides CEGIS, appointed by the Project authority, is also carrying out consultation with the local people with interviews on regular basis for better performance of the Project as a whole.	Being Complied
41	Additional Environmental baseline data to be collected as suggested in the EIA report and conveyed to DoE and other concern authorities.	All quarterly monitoring reports containing latest baseline data are being collected as suggested in the EIA study and are disseminating to DoE and other concerned authorities as instructed.	Being Complied
42	The Environmental Management Plan under the EIA study shall strictly be implemented and kept functioning on a continuous basis.	BIFPCL has been implementing all the EMP measures realistically phase by phase as suggested in EIA report and approval condition of DoE. The status of EMP implementation are also regularly monitored. Based on the monitoring, BIFPCL continuously updated the site specific EMP for better management of the potential impacts.	Being Complied
43	The Project authority shall submit a detail work plan with time schedule of development activities at least 7 (seven) days ahead of the work commences in the field to the Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment simultaneously.	The construction works is now about to finish. BIFPCL practiced the submission the detailed work plan seven (7) days before start of any construction activities to the suggested offices of DOE. This practice will be continued till the end of the project.	Being complied
44	Environmental Monitoring Reports according to specific format specified in the EIA Report shall be made available simultaneously to DoE Bagerhat District Office, Khulna Divisional Office and Headquarters on a monthly basis during the construction period of the Project.	Environmental Monitoring Reports as per specific format provided in the EIA Report made available by BIFPCL and submitted to DoE Bagerhat District Office, Khulna Divisional Office and Headquarters accordingly.	Being Complied
45	The following records must be kept in respect if any samples required to be collected for the purpose of environmental monitoring activities: <ul style="list-style-type: none"> <li>• The date(s) on which the sample was taken;</li> <li>• The time(s) at which the sample was collected;</li> <li>• The point at which the sample was taken; and</li> </ul> The name of the person who collected the sample.	The Monitoring report keeps all the records as suggested.	Being Complied

Sl. No	Condition of DoE	Compliance Status	Remarks
46	The results of any monitoring, required to be conducted under this EIA report must be recorded.	BIFPCL has been collecting all the monitoring data and submitting with proper documentation and accordingly sharing with DoE on regular basis.	Being Complied
47	In case of any emergency, the following information shall be immediately being reported to Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment (DoE) simultaneously. Nature of incident (oil spill, fire, accident. Collision, land slide, etc.). Personnel affected (injured, missing, fatalities, etc.). Emergency support available and its location (standby transport, medical facilities, etc.). Weather conditions Current operations (abandoning the site, firefighting, etc.)	No single emergency incident has occurred since April, 2021. The COVID restriction has been withdrawal by Gov. with the decreasing infection which also implemented for the MSTPP construction site. At present, the labors are working fully to this project with proper COVID safety measures.  BIFPCL has given top priority on safety issues as like environment for this project after the bitter experience of two incidents. They have instructed the EPC contractor to establish best practices on OHAS and keep all records for avoiding any incident as like earlier. However, taking numbers of initiatives by the EPC and proponent significantly improve the safety system of the project. No environmental, accidental, anthropogenic incident has been not recorded since April 2021.	Complied at present
48	The Project authority or its employees must notify the department of Environment of incidents causing or threatening material harm to the environment as soon as practicable after the person becomes aware of the incident.	BIFPCL has established a proper mechanism for recording such incident as suggested and notify the department of Environment regarding incidents causing or threatening material harm to the environment as soon as practicable after the person becomes aware of the incident.  EPC have already revised the health and safety management manual to continue the work amid the COVID pandemic. Moreover, CEGIS is monitoring the EMP implementation as a whole.	Complied at present.
49	All pollution incidents shall be reported immediately and simultaneously to the Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment (DoE) in Dhaka.	BIFPCL has established a proper mechanism for recording such incident as suggested in the ERP	Being complied
50	Appropriate permission would require to be obtained from the Forest Department in favor of cutting/felling on any plant/tree/sapling forested by any individual or government before doing such type of activity.	There is no need of cutting/felling down of any trees outside the project boundary. However, in future, if any such case arises, BIFPCL would seek for appropriate permission from the Forest Department.	Being complied
51	Re-vegetation and re-plantation under green belt activities shall be undertaken in consultation with	An MoU has been signed with Forest Dept., Bangladesh on 24.02.2015 for implementation of Afforestation Program. Initial target was to plant 2 lac saplings	Being Complied

Sl. No	Condition of DoE	Compliance Status	Remarks
	the Forest Department according to those mentioned in the EIA report.	<p>in 3 years. Later another fresh Agreement with BFD was signed on 24.01.2018 for plantation of 5 Lakh trees for at the end of construction stages.</p> <p>Under these plantation program initiated by Bangladesh Forest Department (BFD) about 80,000 trees of different species has already planted and another 30,000 to 50,000 trees plantation will be finished by next April to May, 2022.</p> <p>However, BFD and BIFPC is optimistic to fulfill the target before commissioning of the power plant.</p>	
52	Climate Change impacts and maximum storm surge height shall have to consider at the design and construction phase.	The design level (elevation) of the land and earthen embankment has designed and constructed considering the climate change impact and maximum storm surge height.	Being Complied
53	A separate EIA/morphological study shall have to be conducted for coal transportation and river dredging to develop sound environmental management plan towards conservation of ecosystem and biodiversity.	Coal transportation will be done through the existing maritime route, which is Mongla Port Authority (MPA) controlled waterways. M/s. Institute of Water Modelling (IWM) has already completed the EIA study for the dredging activity and submitted the report to MPA. A separate EIA study for Coal Transportation was conducted by M/s. Center for Environment and Geographic Information Services (CEGIS) which has been approved by DoE.	Being Complied.
54	A full-fledged institutional setup for EHS and CSR must be put in place before operation of the Power Plant.	<p>A full-fledged institutional setup for EHS activities have been operated. After the consecutive accidents, the EHS process has been drastically re-arranged and reshaped. As a result, no major incident has been occurred since April, 2021. Safety walk-down by the EHS team inside the plant premises help to identify and register all kind of accident and incidental hazards if occurred and take immediate remedy measures.</p> <p>Meanwhile, a number of CSR activities like free medical camp, Boat Medical camp and medicines, free potable water supply to the local people, medical campaign, blanket distribution to the local people, EHS training, infrastructure development etc. are being conducted by the BIFPCL authority as a continuous process at the plant site.</p>	In the process of compliance
55	The Project authority shall extend active cooperation to DoE officials to facilitate their visit to the site as and when necessary.	BIFPCL is extending its all-out cooperation to DoE.	Being Complied
56	Violation of any of the above conditions shall render this approval void.	Noted by BIFPCL	
57	Any injunction on this Project from the Honorable Supreme Court/High Court Division shall render this approval void.	Noted by BIFPCL	

Sl. No	Condition of DoE	Compliance Status	Remarks
58	Without installation of 275 Meter Height Chimney, Effluent Treatment Plant (ETP), Waste Water Treatment Plant (WWTP), Settling Pond, Desalinization Plant, API Oil Water Separator, High Efficiency Electro Static Precipitator (ESP), 'closed-loop' Flue Gas Desulfurization (FGD), Low NOx Burner, online air and water quality monitoring system and other pollution control equipment and obtaining Environmental Clearance Certificate, the proponent shall not start operation of the Project.	<p>At present, the Plant is in construction phase. Some of the required parameter from DoE are ready, some are under ready and some will be ready before operation phage.</p> <p><b>Current status:</b></p> <ul style="list-style-type: none"> <li>• <b>Chimney:</b> civil works of the 275-meter height Chimney has already completed (pic attached)</li> <li>• <b>DM water plant:</b> Almost completed. Now the equipment fixation and other instrumental works are ongoing</li> <li>• <b>Effluent Treatment Plant (ETP):</b> Civil works of the ETP in under-way. Will be finished soon</li> <li>• <b>Electro Static Precipitator (ESP):</b> Almost ready. Now the insulators are being installed.</li> <li>• <b>Flue Gas Desulfurization (FGD):</b> Structural works has completed. Mechanical and instrumental works are ongoing</li> <li>• <b>Desalinization plant:</b> One Stream is running while rest are under construction</li> <li>• <b>Low NOx Burner:</b> Ready for operation except some instrumental adjustment</li> <li>• <b>Settling pond:</b> Ready</li> <li>• <b>Online air and water quality monitoring system:</b> It will be in operation before the commissioning of the plant</li> </ul> <p>Moreover, BIFPCL has got the Environmental Renewal Certificate each of the year through maintaining the conditions of DOE.</p>	Compliance action initiated
59	This EIA Approval has been issued with the approval of the appropriate authority.	BPDB and BIFPCL are thankful to DoE.	

## 5.2 Compliance to the Conditions of DoE (EIA study of Coal Transportation)

However, with reference to the approval of EIA study of coal transportation for 2x660 MWMSTPP having (Memo no: DoE/ clearance/ 5532 / 2016/50, dated 31/01/2018), Department of Environment has set some specific conditions to be followed as a fulfillment of the condition no.53 of the EIA approval letter of 2x660 MWMSTPP. The conditions and compliance status have been listed as follows-

**Table 5.6: Compliance conditions of DoE (EIA study of Coal transportation)**

Sl. No.	Conditions	Compliance status	Remarks
1	This EIA Report is approved only for Coal Transportation for the Proposed 2x660 MW Maitree Super Thermal Power Plant Project. Any modification of this project as well as Coal Transportation will require further EIA approval with additional EIA Study.	The power plant is now in construction stage. BIFPCL will notify to DOE prior to initiation of any modification, expansion or extension of the Power Plant.	Suggested to comply as and when required.
2	The route of coal Transportation should be maintained as per EIA Report. In case of any changes the proponent must obtain consent from DoE.	The route of coal Transportation will be maintained as stated in the EIA report. In case of any changes in the transportation route, the proponent shall obtain consent from DoE.	Suggested to comply as and when required.
3	Project Proponent may open L/C (Letter of Credit) for importing machineries for the project which shall also include machineries relating to waste treatment plant and plant and other pollution control devices.	EPC contractor has been appointed for this Project. They are importing all the Power Plant machineries complying with the national laws and regulations.	Being Complied.
4	The activity under Coal Transportation for the Proposed 2x660 MW Maitree Super Thermal Power Plant Project shall not release any pollutant that affect human health or will have damaging impact on the environment or natural resources.	So far, no activity under Coal Transportation for the Proposed 2x660 MW Maitree Super Thermal Power Plant Project has been commenced. So, there is no issue for impact on the surrounding environment or natural resources from the coal transportation activities. BIFPCL engaged CEGIS for monitoring and examining status of the environment or natural resources. A strong baseline has been prepared throughout the coal transportation route for assessing the impact in future.	Suggested to comply as and when required.
5	Proper and adequate mitigation measures shall be ensured throughout the operation period of the Project	The project proponent has included all the mitigation measures in their BID document of Coal Transportation. However, BIFPCL is monitoring the implementation of mitigation measures for the entire jetty construction period. They have developed a skilled manpower and system for ensuring the EMP during operation stage as well.	Suggested to comply at operation phase.
6	Any heritage site, ecologically critical areas, and other environmentally, religious and archeologically sensitive	There is no Religious and Archaeological place in and around the Project site. As a third party, CEGIS is now monitoring the	Suggested to comply at operation phase.

Sl. No.	Conditions	Compliance status	Remarks
	places shall be kept protected during project operation.	potentially vulnerable locations and indicators which are sensitive to coal transportation in the Sundarbans ECA, Sundarbans Reserve Forest and Sundarbans World Heritage Site. Those information and data assist to protect the ecological critical areas in future during the operation of coal transportation.	
7	Environment friendly construction and development practices shall be followed that minimize loss of habitats and fish breeding, feeding and nursery sites.	Development of coal transportation system will be followed through best practices, EMPs of EIA of Coal Transportation Report, national and international rules and guideline. Since, the environmental monitoring indicators are not observed any anomalies, it can be concluded that the construction work is progressing in environment friendly procedure till now.	Being Complied
8	Proper and adequate sanitation facilities shall be ensured in labor camps throughout the proposed project period.	BIFPCL, EPC contractor and sub-contractors has ensured the sanitation facilities for the labour camps and providing sufficient safety materials, training, instruction and facilities for managing COVID-19 to improve hygienic condition at labor camps and workplaces.	Being Complied
9	Proper and adequate on-site precautionary Measures and safety measures shall be ensured so that no habitat of any flora and fauna would be endangered or destructed.	All the finished construction works so far including the Jetty has been followed in accordance with the EMP guidelines sated in the EIA report. Moreover, regular monitoring activities will be carried out to assess the significant changes (if any) for the rest of the unfinished works. The quarterly monitoring reports do not reflect any significant changes of the habitat of flora and fauna of the project influenced Passur river and Sundarbans ecosystem.	Being Complied
10	All the required mitigation measures Suggested in the EIA report along with the emergency response plan are to be Strictly implemented and kept operative/functioning on a continuous basis.	<p>The proponent is giving top priorities to occupational health and safety issues. To keep the workers and the plant safe, plenty of precautionary measures has identified during the physical visit of the plant.</p> <ul style="list-style-type: none"> <li>An ICU rich hospital with an experienced medical team and ambulance has kept ready to provide the instant services</li> <li>In case of emergency situation for both BIFPCL and EPC contractor, a contract has been signed with a private hospital (GAZI medical, Khulna) for medical services.</li> </ul>	Being complied CEGIS team has suggested to fix more such type of posters to other parts of the plant premises

Sl. No.	Conditions	Compliance status	Remarks
		<ul style="list-style-type: none"> <li>Emergency fire exit, the fire extinguisher, fire alarm has observed available and well-functioning.</li> <li>As a part of emergency response plan emergency contact numbers contained laminated poster has noticed beside the construction site.</li> </ul> <p>EHS team of BIFPCL, BHEL and Chola mandalam are compelling to ensure the safety mitigation measures as per EIA and EHS guideline. Moreover, Periodic training has been made as mandatory for the workers.</p> <p>BIFPCL working hard to build awareness about Covid-19 among workers and office support staff. Thermal scanning of workers is being done at regular frequency for checking COVID symptom.</p>	
11	To control dust, spraying of water over the earthen materials should be carried out from time to time	Periodic air quality monitoring in and around the project sites is being conducted and checked it with ECR, 2005 standard. BHEL has contracted with an external company for three years (renewable) who are continuously spraying water as per schedule by three (03) water tankers to suppress fugitive dust.	Being Complied
12	The entire coal handling system should be designed as an enclosed (and not only covered) conveyor system. There should be integrated dust control system with dust extraction and bag filters at unloading areas and at each transfer points on the conveyor system.	In the BID document, the coal handling system has been mentioned as closed system with the integration of dust control measures. Moreover, continuous monitoring system has been instructed in the EIA monitoring section.	Compliance action initiated
13	Coal should be stored in a covered storage yard.	All these stipulations have been included in the technical specification of Main Plant EPC contract package, Section V, B4 of Technical Specification (Clause No B4.3.1.6). The Covered coal stockyard construction is now at final stage.	Compliance Action initiated.
14	The entire coal stockyard should be Covered with water sprinkler provided with automated moisture sensor to control self-combustion.	EIA study of the Power Plant suggested to install water sprinkler in coal stockyard which has been repeated in EIA study of Coal transportation. However, all these stipulations have been included in the technical specification of Main Plant EPC contract package. The Covered coal stockyard construction is now at final stage.	Compliance Action initiated.
15	Construction material should be properly disposed of after the construction work is over.	Most of the civil works has already finished and now the mechanical and electrical works are going at full phase.	Being complied Though there colored waste

Sl. No.	Conditions	Compliance status	Remarks
		During the field visit we found all the mechanical and construction residual are being kept at demarcated places. For the solid waste management, BHEL has engaged a company named Rahman & brothers in association with Khulna City Corporation (KCC) for collecting and safe disposal of waste materials from site. There is a provision of development of solid waste management system which is given at clause no B12 ,Part no 9 of book no -2 ,page no 147-161. <b>In which development of WMC will ensure waste collection ,waste segregation at source, recycling ,treatment and disposal of waste.</b>	collection bin but CEGIS has suggested to put the written label on the box to classify the waste easily
16	As described in the report environmental monitoring should be strictly followed and monitoring report should be shared with DOE to ensure the environmental management properly.	BIFPCL has engaged CEGIS for environmental monitoring the environmental management plan in February 2014. Accordingly, each quarterly monitoring report has been submitted and shared with DoE, which are also available at BIFPCL web site.	Being Complied.
17	A third party/independent monitoring bodies excluding BIFPCL should be engaged immediately for monitoring of all the activities during pre-construction, construction and operation phases as per monitoring plan of EIA report and monitoring report must be submitted to Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment simultaneously.	CEGIS, as an independent monitoring body has been engaged by BIFPCL since February 2014 and still continued. From then on, CEGIS has been conducting the monitoring programs quarterly and producing monitoring reports on regular basis which are submitted by CEGIS to BIFPCL for onward submission to the Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment as directed by DoE.	Being Complied
18	Regular monitoring of the susceptible places of the Sundarbans for protecting ecosystem, biodiversity and forest coverage should be made using latest high-resolution image for keeping ambient environment.	The Monitoring activities have been carried out by CEGIS as third-party independent entity. The study includes all of recommended issues vastly. The monitoring report contains analysis of ecosystem, habitat, and biodiversity and forest coverage at susceptible sites of Sundarbans. In addition to this, Forest Department has also suggested some survey & analysis of Sundarbans ecosystem along with the quarterly compliance monitoring report.	Being Complied.
19	Air, water, soil, biological and social data should be monitored regularly with a network monitoring system with a view to assess the natural quality of the Sundarbans and other fragile ecosystem and report of monitoring results should be submitted to Bagerhat District Office,	The network monitoring system will be installed as a part of the project construction for online monitoring and it will run at the time in operation phase. All these stipulations have been included in the technical specification of Main Plant EPC contract package. (Section-V, Clause	Being Complied.

Sl. No.	Conditions	Compliance status	Remarks
	Khulna Divisional Office and Headquarters of the Department of Environment simultaneously.	No B0 6.19.13.2 and Clause No. B0 6.19.13.5). All the environmental monitoring reports are available on the BIFPCL website at present.	
20	There should be regular disclosure of the report through workshops and websites and responses should be taken care accordingly.	All of the environmental monitoring reports and other relevant reports are available on website of BIFPCL ( <a href="http://www.bifpcl.com">www.bifpcl.com</a> ). BIFPCL as well as CEGIS is regularly carrying out public consultation at local level to get the responses from the community.	Being Complied.
21	BIFPCL should provide all sort of logistics support to DOE and other relevant agencies for monitoring environment related items/events.	BIFPCL is ready to provide all sort of logistic support as and when required by DoE and other relevant agencies for monitoring of Plant construction activities and environmental items/events.	Suggested to Comply as and when required.
22	In order to control noise pollution, vessels and equipment shall undergo regular maintenance; working during sensitive hours and locating machinery close to sensitive receptor shall be avoided.	Not applicable in this stage	Suggested to Comply as and when required.
23	Vessels of this project should follow the MPA guidelines and protocol to ensure no hindrance to other vessels.	Not applicable in this stage	Suggested to Comply as and when required.
24	The vessels used for this project should maintain IMO criteria to enable identification of substances harmful to the marine environment.	Not applicable in this stage	Suggested to Comply as and when required.
25	All the vessels should follow applicable MARPOL Convention, Appendix V on the prevention of pollution by garbage from ships.	Not applicable in this stage	Suggested to Comply as and when required.
26	Additional Environmental baseline data to be collected as suggested in the EIA report and conveyed to DOE and other concern authorities.	Environmental baseline data has been collected by third party <i>i.e.</i> CEGIS. CEGIS has submitted reports of quarterly monitoring containing latest baseline data to BIFPCL for further dissemination to DoE and other concerned authorities.	Being Complied
27	The Environmental Management Plan under the EIA study shall strictly be implemented and kept functioning on a continuous basis.	BIFPCL has so far been implementing the EMP measures phase by phase as suggested in EIA report and approval condition of DoE. The status of EMP implementation are also regularly monitored by CEGIS.	Being Complied
28	The project authority shall submit a detail work plan with time schedule of development activities at least 7 (seven) days ahead of the work commences in the field to the Bagerhat District Office,	The jetty construction works is now completed. Beforehand, BIFPCL submitted the detailed work plan seven (7) days before starting of the construction activities to the Bagerhat District Office,	Being complied

Sl. No.	Conditions	Compliance status	Remarks
	Khulna Divisional Office and Headquarters of the Department of Environment simultaneously.	Khulna Divisional Office and Headquarters of the Department of Environment simultaneously. It must be maintained in future.	
29	Environmental Monitoring Reports According to specific format specified in the EIA Report shall be made available simultaneously to DOE Bagerhat District Office, Khulna Divisional Office and Headquarters on a quarterly basis during the project period.	Environmental Monitoring Reports are being produced as per specific format provided in the EIA from the beginning till now. Report's content are disclosed by BIFPCL and submitted to DoE Bagerhat District Office, Khulna Divisional Office and Headquarters on monthly basis since April, 2018.	Being Complied
30	The following records must be kept in respect of any samples required to be collected for the purposes of environmental monitoring activities: a) the date(s) on which the sample was taken; b) the time(s) at which the sample was collected; c) the point at which the sample was taken; and The name of the person who collected the sample.	The Monitoring report of CEGIS keeps all the records as suggested.	Being Complied
31	The results of any monitoring required to be conducted under this EIA report must be recorded.	CEGIS is maintaining database for all monitoring data analysis result and submitting to BIFPCL through proper documentation. The report is being shared with DoE on regular basis through monitoring reports.	Being Complied
32	In case of any emergency, the following information shall immediately be reported to Bagerhat District Office, Khulna Divisional office and Headquarters of the Department of Environment (DOE) simultaneously: a. Nature of incident (oil spill, fire, accident, collision, land slide etc.) b. Personnel affected (injured, missing, fatalities, etc.) c. Emergency support available and its location (standby transport, medical facilities, etc.) d. Weather conditions Current operations (abandoning the site, firefighting, etc.)	Emergency Reporting/ Emergency response Plan has been prepared and maintained for the Jetty construction (already finished) and will be followed for the coal transportation issues in future. As Coal transportation and its management is very sensitized to Environment and human body, Health and safety management manual have been revised for better and pre-cautious implementation of OHAS. Though BIFPCL has already put a top priority on OHAS issue, extra care will be ensured for this coal related issues. BIFPCL will adopt the ERP suggested on the EIA study of coal transportation in association with the NOSCOP and NPDM for any future incidents as suggested.	Compliance Action initiated.
33	National Oil Spill Contingency Plan (NOSCOP) should be followed to establish an organizational structure to combat marine pollution	Not applicable in this stage	Suggested to comply as and when required.

Sl. No.	Conditions	Compliance status	Remarks
34	The project authority or its employees must notify the Department of Environment of incidents causing or threatening material harm to the environment as soon as practicable after the person becomes aware of the incident.	BIFPCL has strengthened the mechanism for the incident as suggested that is notify to DoE regarding incidents causing or threatening material harm to the environment as soon as practicable after the person becomes aware of the incident. The institutional arrangement for managing the incident during coal transportation will be set up before operation stage based on the EIA and DoE recommendations. Moreover, monitoring activities is continued for checking any significant changes in natural ecosystem.	Complied at Present.
35	All pollution incidents shall be reported immediately and simultaneously to the Bagerhat District Office, Khulna Divisional Office and Headquarters of the Department of Environment (DOE) in Dhaka.	BIFPCL has established a proper mechanism for recording such incidents as suggested in the ERP. CEGIS has been engaged to monitor the social and environmental compliance monitoring on a regular interval.	Complied at Present.
36	Climate Change impacts and maximum storm surge height shall have to consider at the design and construction phase of the jetty.	The design level (elevation) of the land and earthen embankment has been fixed considering the climate change impact and maximum storm surge height.	Being Complied
37	The transshipment point Faraway Buoy at the Bay should be used from November to March, and Mazhar point should be used from April to October every year for transporting coal which has been mentioned in the EIA Report.	Not applicable in this stage	Suggested to comply as and when required.
38	Violation of any of the above conditions shall render this approval void.	Noted by BIFPCL	-
39	Any injunction on this project from the Honorable Supreme Court/High Court Division shall render this approval void.	Noted by BIFPCL	-
40	This EIA approval is valid for one year from the date of issuance and the project authority shall apply for renewal to the Bagerhat District Office of DoE at Bagerhat with a copy to Head Office of DOE in Dhaka.	The authority is maintaining the renewal process as suggested. As like previous years, BIFPCL has got the renewal for this year.	Being complied

### A glimpse of project activities

275 m chimney

Temporary chemical lab

Civil works of ETP

Water sprinkling

Fresh water storage tank

Construction of FGD

Construction of closed coal conveyor belt

Emergency contact no

## **Appendices**

## Appendix I: Checklist of Monitoring Environmental Compliances

**Table A: Checklist of Monitoring for ESMP Implementation (During Construction Phase)**

SI No	Potential Impacts	Proposed EMP	Actual Implementation	Recommended Action	Compliance Status
1	Generation of Noise within the BIFPCL's Plant premises	Conduct noise survey around and inside the site boundary Reducing Noise and Vibrations to country's ambient standards, and occupational health and safety standards Introducing vehicle speed limit and speed limit monitoring system Green Plantation around the Project boundary Switching off/ throttling down of machines/equipment's/generators which are not in use			
2	Dust Generation from Land development activities and other construction works	Conducting dust monitoring and visual inspection around the site boundary No use of earthen and undeveloped roads by vehicles related to the Project use Installation of water spraying system to control fugitive dusts Introducing vehicle speed limit and speed limit monitoring system If yes, do they monitor vehicle speed regularly?			
3	Water Quality	Fencing the construction site by drum sheet or Tarjja of any other fencing Arrangement of runoff drainage for reducing any water logging Location of backfilling stockpile in safe area and protected from wind and rain action No storing of backfilling materials/spoil stored on river bank/slope No disposal of waste and wastewater to river or canal.			
4	Waste Management System	Provision of onsite waste management system			
5	Compensation and Resettlement	Prepare Proper resettlement action plan and compensation plan if the Project needs any land acquisition addressing compensation, restoration, livelihood, living standards etc. based on proper socio-economic studies Resettlement of the PAPs cash for compensation of land (CCL) before resettlement formal agreement with the affected people prior to migration/resettlement Sufficient standing crop compensation			

SI No	Potential Impacts	Proposed EMP	Actual Implementation	Recommended Action	Compliance Status
		Compensation for shift able structures? Retention of salvageable materials? Compensation for loss of trading income? one-time moving assistance grant to cover loss of regular wage income Has a resettlement plan been developed which includes compensation, restoration, livelihood, living standards etc. based on proper socio-economic studies? Provide/take extra care/caution for the disadvantaged/vulnerable group(s) (i.e., women, children, ethnic minorities, indigenous people etc.) Provision of monitoring the compensation and resettlement process			
6	Livelihood and living	Does the Project pose any threat to the livelihood/living standards of the local people? If yes, are adequate steps taken to reduce the impacts? Has the company developed any policy which prioritizes the local laborers in employment opportunities? Is there any possibility that large vehicle related to the Project will cause traffic induced disturbance/s to the local dwellers? If yes, are there any mitigative steps taken to decrease the disturbance/s? Has the road network been developed after the Project being proposed and during the construction phase? Are there separate water and sanitation facilities for the construction workers in the Project area?			
7	Green House Gas Controlling Measures	Use of efficient generator in the construction activities Regular maintenance of vehicles, generator and machinery in accordance with manufacturer's specifications Use of approved pollution control devices fitted in the equipment's and machineries Switching off and throttling down the machines/equipment's/generators which are not in use			

**Table B: Checklist of Monitoring ESMP Implementation (During Construction phase)**  
**(Labor and Working Condition)**

**Basic Data**

SI No	Description	Values
1	Direct Workers	
2	Contracted Workers	
3	Supply Chain Workers	
4	Child labor	
5	0 - 12	
6	13 - 14	
7	14 - 18	

**Checklist for Labor and Working Condition**

SI No	Potential Impacts	Proposed EMP	Actual Implementation	Recommended Action	Compliance Status
1	Working Conditions and Management of Worker Relationship	<ul style="list-style-type: none"> <li>• Preparation of Human Resources Policies and Procedures for Direct workers</li> <li>• Defined Working condition and Terms of Employment for direct worker</li> <li>• Sustainably equivalent terms and condition for migrant workers</li> <li>• Compliance to national law of forming workers' organization</li> <li>• No discrimination and equal opportunity for all</li> <li>• Measures for diminishing past discrimination</li> <li>• Grievance Mechanism</li> </ul>			
	Protecting Workforce	<ul style="list-style-type: none"> <li>• The client will not employ children in any manner that is economically exploitative, or is likely to be hazardous or to interfere with the child education, or to be harmful to the child's health or physical, mental, spiritual, moral, or social development.</li> <li>• No Force Labor</li> </ul>			
2	Safety at site	<ul style="list-style-type: none"> <li>• Installation/Construction of Safety Fence around the Project area</li> <li>• Use of Personnel Protective Equipment (i.e. safety suit, safety goggles, ear plug, safety shoes, gloves, dust mask, etc.)</li> </ul>			

SI No	Potential Impacts	Proposed EMP	Actual Implementation	Recommended Action	Compliance Status
		<ul style="list-style-type: none"> <li>• Safety trainings for workers (i.e. fire control, working at height, working in heat, first aid etc.)</li> <li>• Practice of Tool box meeting, safety talks,</li> <li>• Safe Storage of Hazardous Chemicals (e.g. fuel, flammable chemical, toxic chemicals, etc.)</li> <li>• Maintaining Material Safety Data Sheet (MSDS)</li> <li>• Provision of Health care facilities such as doctor, hospital etc. available at/nearby the plant construction site</li> <li>• Availability of First Aid at work place</li> <li>• Preparation and Follow of Emergency Response Plan</li> <li>• Adequate fire precautions in place (for example, fire extinguishers, escape routes etc.)</li> <li>• Documentation and reporting of occupational accidents, diseases, and incidents</li> <li>• Policies and procedures for managing and monitoring the performance of third-party employers in relation to OHS</li> </ul>			
3	Occupational Health and Safety Procedure	<ul style="list-style-type: none"> <li>• Provision of complete EHS division in the Human Resources Planning/Organogram</li> <li>• Preparation of Safety Policy to be adopted during plant operation</li> </ul>			
4	Worker's Well Being	<ul style="list-style-type: none"> <li>• Establishment Grievance Mechanisms</li> <li>• Ensuring fair treatment, non-discrimination and equal opportunity</li> <li>• Compliance of Project's labor policy with the national labor law</li> <li>• No Child Labor</li> <li>• No incident of forced labor</li> <li>• Provision of Welfare facilities for Worker/Labor</li> </ul>			

**Table C: Checklist of Monitoring ESMP Implementation (During Construction phase)**  
**(Community Health, Safety and Security)**

SI No	Potential Impacts	Proposed EMP	Actual Implementation	Recommended Action	Compliance Status
1	Disturbance to nearby community due to dust from newly developed land and Noise from construction activities	<ul style="list-style-type: none"> <li>• Construction of boundary wall around the Project are</li> <li>• Installation of water spraying system to control dusts</li> <li>• Conducting dust monitoring and visual inspection around the site boundary</li> <li>• Adoption of Noise management plan</li> </ul>			
2	Grievance of local people	<ul style="list-style-type: none"> <li>• Availability and operation of Grievance Redress Mechanism</li> <li>• Maintaining open communication channel with the local community</li> </ul>			
3	Risk of breaching Community Safety	<ul style="list-style-type: none"> <li>• Construction of boundary wall/safety fence around the Project area</li> <li>• Practicing Risk Assessment and Evaluation Process</li> <li>• Practicing safe management for hazardous materials which may pose threat to the community</li> <li>• Availability and operation of Emergency Response Plan</li> <li>• Maintaining open communication channel with the local community</li> <li>• Training and instruction to the security personnel about their behaviour and communication with the local people</li> <li>• Aware the security personnel about the right of the community people</li> </ul>			
4	Community Health Risk	<ul style="list-style-type: none"> <li>• Provision of providing health service facilities to community if the Project possess any health risk like sexually transmitted disease, communicable disease, vector-borne diseases</li> <li>• Implement all pollution mitigation measures to ensure safeguarding to community</li> </ul>			<i>(Continued)</i>
5	Youth Employment	<ul style="list-style-type: none"> <li>• Providing training/awareness program for the local youth to let them aware about the required qualification to get involved in the Project related activities</li> </ul>			
6	Public Communication, Consultation and Awareness	<ul style="list-style-type: none"> <li>• Arranging public communication/consultation meeting</li> <li>• Sharing of Project information with local people</li> <li>• Organizing environmental and social awareness programs/meetings</li> </ul>			

**Table D: Checklist of Monitoring ESMP Implementation (During Construction phase)**  
**(Biodiversity and Sustainable Management of Living Natural Resources)**

Sl No	Potential Impacts	Proposed EMP	Actual Implementation	Recommended Action	Compliance Status
1	Runoff (contain mostly sediment load) from newly developed land falls into nearby river and channel.	<ul style="list-style-type: none"> <li>• Installation of proper run on/runoff drains</li> <li>• Use of sediment fences, traps and basins for trapping the sediment, if required</li> </ul>			
2	Disturbance to nearby ecosystem due to different construction activities	<ul style="list-style-type: none"> <li>• No cutting/ felling of trees along the river bank</li> <li>• Implementation of on-site waste and air quality management plan</li> <li>• Limiting soil extraction activities limited within the defined area</li> <li>• Limiting the vegetation clearance and base stripping process within the Project boundary</li> <li>• Safety fence around the construction site</li> <li>• Limiting the use of night light</li> <li>• Using shade (directed downwards) around the outdoor lights</li> <li>• Provision of cut-off time to switch off unnecessary lights at night</li> <li>• Initiate Green plantation</li> <li>• No plantation of non-native species</li> <li>• Retaining top soil for future habitat restoration</li> <li>• No degradation of critical habitat?</li> </ul>			
3	Occupation of river, inter-tidal areas and wetlands	<ul style="list-style-type: none"> <li>• No encroachment of inter-tidal flood plain area</li> <li>• No disturbance to Dolphin community</li> <li>• Monitoring of Ecosystem Health and Monitoring of Sundarbans Forest Health</li> <li>• If required, embankment should be constructed considering a setback distance from river/canal bank</li> <li>• Slope protection work along the Maidara River should be completed on an urgent basis before rainy season come and</li> <li>• BIFPCL may take initiatives of excavating of silted reach of Maidara river near proposed township area to facilitate proper functioning of River for maintaining tidal dynamics</li> </ul>			

## Appendix II: Photo Album

### Environmental and Socio-economic Monitoring of Khulna 2×660 MW Power Plant for 31<sup>st</sup> monitoring program (January, 2022)

Monitoring team

Canopy cover measurement

Forest health data collection

Mesuring tree DBH

Observing tree height

Forest soil collection

Insitu water Sampling & data collection

Observing the fishing activities and data collection

## Appendix III: Terms of References (ToR)

### Background

Bangladesh-India friendship Power Company (Pvt.) Ltd. (BIFPCL), a 50:50 Joint Venture Company of Bangladesh Power Development Board (BPDB) of Bangladesh & NTPC Limited of India is implementing a coal based thermal power plant named 2X660 MW Maitree Super Thermal Power Project at Rampal in Bagerghat District of Khulna Division of Bangladesh. The plant is envisaged to be based on super critical technology and is to be operated as Base Load Plant. The fuel envisaged is imported coal.

### General Description of 2X660 MW Maitree Super Thermal Power Plant Project

<b>Project Location:</b>	<p>Upazila: Rampal, District: Bagerhat Site is located at 23 kms Southward of Khulna City and 14 kms. North-Eastward from Mongla Port.</p> 
<b>Project Capacity:</b>	1320 MW (2x660 MW), based on Ultra Super-critical Technology
<b>Mode of Operation:</b>	Base Load
<b>Fuel:</b>	Imported Coal
<b>Fuel Transportation:</b>	It is envisaged that imported coal from countries like Indonesia, Australia shall be transported through bigger ships, up to trans-shipment point, from where the coal shall be transported through barges to the coal

	unloading jetty at the plant end. From jetty to the power plant coal shall be transported through coal conveyor system.
<b>Land &amp; Land Development:</b>	Based on the layout in the FR, it is estimated that approx. 575 acres of land will be required for the project. (375 Acres for Main Plant, 50 Acres for Township, 50 Acres for Jetty).
<b>Evacuation of power:</b>	Provision of line bays in generation switchyard for one no. 400 kV Double Circuit line and one no. 230 kV Double Circuit line have been kept. The Power evacuation (transmission line) system from the Project shall be at 400 kV level and will be outside the scope of the Project. 400 kV is being introduced for the first time in Bangladesh.
<b>Expected Timeline for project implementation</b>	The first unit of capacity 660 MW is scheduled to be synchronised in 41 months from the date of NTP to the EPC contractor for the Power project. Commissioning of the first unit of capacity 660 MW is envisaged at an interval of 5 months thereafter.

### **Broad Scope of Works**

The study covers quarterly monitoring of different environmental and social parameters, and implementation of EMP (Environment Management Plan) during implementation phases as per DoE approval/requirement. The monitoring locations were selected based on physical activities, wind direction, sensitive receptors, etc. and were finalized through the consultation with DoE, Department of Fisheries (DoF), MPA and Forest Department (FD).

### **The Broad objectives of independent monitoring covers the following activities**

- Monitoring implementation of EMP and environmental compliance;
- Monitoring of ambient air quality, noise level and water quality;
- Monitoring of cropping pattern and soil quality;
- Monitoring of fisheries resources covering fish habitats, biodiversity, migration and production;
- Monitoring of ecosystem and biodiversity;
- Monitoring of the Sundarbans Forest Health; and
- Monitoring of socio-economic condition and livelihoods.
- To evaluate the project environmental performance as due to construction activities.

### **The main objectives of this works are**

- Monitoring of Social and Environmental parameters to update the baseline.
- Monitoring of Social and Environmental parameters during Implementation of the Project.
- Assistance to BIFPCL for implementation of Environmental Management Plan (EMP) during construction period.
- The scope of work of the Independent Monitoring will include the following specific tasks

- 
- Develop specific monitoring indicators, checklists, and questionnaires to undertake independent monitoring (a preliminary list of monitoring indicators has been given in the EMP) in consultation with BIFPCL, DoE, Forest Department and the Financer;
  - Review and verify the implementation progress of various EMP elements, particularly, mitigation plan, compliance monitoring, environmental trainings, documentation, and grievance redress mechanism;
  - Physical aspects would cover air quality, noise level, water quality and land resources;
  - Biological environment includes fisheries resources, ecological resources, Sundarbans Reserve Forest (SRF) health conditions including WHS;
  - Environmental compliance monitoring includes Monitoring of Environmental and Social Management System Action Plan Implementation, monitoring of labour and working conditions, monitoring of community health, safety and security and monitoring of biodiversity and sustainable management of living natural resources.
  - To establish baseline environmental conditions;
  - Provide and monitor the environmental parameter during construction activities.
  - To detect adverse environmental impacts for river dredging and other activities of site development;
  - Provide technical assistance to the client for implementation of the EMP during the power plant construction at different sector of construction activities.
  - To demonstrate whether the environmental control measures are operating as per designed;
  - To provide data for emission inventories;
  - To provide data at regular intervals for dissemination to the stakeholders
  - To provide data for improvement and updating of the monitoring program;
  - To assist in investigating the event of a trigger level or emission limit value being crossed.
  - Update baseline data as per monitoring schedule and location.
  - Provide technical assistance to the client for implementation of the EMP during power plant construction.
  - Review the EIA document to evaluate the EMP measures incorporated in the contract to mitigate different social and environmental hazards and risks during construction of the Project
  - Submit progress reports to the client.
  - Physical observation to assess that all mitigation measures mentioned in EMP are carried out in all place.
  - Sampling and carrying out necessary analysis of Environmental parameter such as surface & ground water quality, air quality, noise, Biological Environment, Socio-economic environment, Sundarbans Forest health etc. according to the monitoring framework in construction phase.
  - Morphological changes of the adjacent river of the project will be influenced by the constructional activities. River bank erosion-accretion, drainage system, tidal inundation etc. will be investigate after regular intervals in the study area as per monitoring location of the EIA. The procedure of investigation and methodologies of analysis will be the same as pre-construction phases. River bed pollution will be identified though this study during construction of the power plant.
-

- Monitoring of floral resources will be performed quarterly. The indicators and procedures of flora monitoring will be relatively same as earlier studies of this projects. Plant composition, canopy coverage, indigenous and exotic species, plant intensities will be the main monitoring indicators during construction phases.
- Monitoring of faunal resources will be performed quarterly at the construction period. Faunal resources survey will coincide with floral resources survey as it will provide more insight about the inter-dependency between flora and fauna in an ecosystem.
- Render any other related services as and when requested.
- Conduct community level consultation in a regular interval and disclose project level information.
- Keep liaison with different organization like Govt department, NGOs, and relevant stakeholders.

**The Monitoring parameter & associated indicator are given below**

Monitoring Parameter	Indicators
Socio-economy	Livelihood and Occupation
	Income and expenditure
	Displacement and Migration
	Cultural and heritage
	Health and sanitation
	Risks and accidental assessment
	Transportation and communication
	Public and private Infrastructure development
Ecology and Biodiversity	Bio-indicator Assessment
	Movement of indigenous/ native species
	Envision of exotic species and regime dominance
	Species composition (Flora and Fauna)
	Assessment the services of dependent ecosystem
Agriculture	Land use and canopy coverage
	Soil quality (Salinity, pH, OM,)
	Cropping pattern and crop intensities
	Irrigation and crop production
	Farmers survey result
Fisheries	Fish diversity and specification
	Fish production and availability
	Fisher survey result
Noise level	Sound level at the sensitive zone
Water resources	DO, BOD, COD, Salinity, TDS, TS, pH, Hg, Pb
	Total Hardness, Hg, NO <sub>3</sub> and PO <sub>4</sub>
	River Morphology,
	Tidal inundation
	Drainage Network
	Erosion and Accretion
	Ground water quality
Air quality	SO <sub>x</sub>

Monitoring Parameter	Indicators
	NO <sub>x</sub>
	SPM (PM <sub>10</sub> and PM <sub>2.5</sub> )
	CO

### Air quality monitoring progress

The most commonly used method for automatically monitoring air pollutant such as those above are:

- SO<sub>x</sub>: measured by Fluorescent signal generated by exiting SO<sub>2</sub> with UV light
- NO<sub>x</sub>: measured by Chemiluminescent reaction between NO<sub>x</sub> & O<sub>3</sub>
- O<sub>3</sub>: measured by ultra violet absorption analyzer, this determines the Ozone concentration by the attenuation of 254 nm UV light along this signal fixed path cell
- Particulate matter (SPM, PM<sub>10</sub>, PM<sub>2.5</sub>): measured by gravimetric methods including true micro weighing technology for automatic monitoring & instrument named 'Tapered element oscillating micro balance (TOEM)' has been most frequently used. Measurement on filter tape using the principles of beta attenuation for estimating 30 mnt or 1 hr average concentrations of PM<sub>10</sub> or PM<sub>2.5</sub> has also been used.
- CO: In urban air pollution studies, a non-disruptive infrared photo meter utilizing a gas filter co relation technology & state of the art optical & electronic technology is used to measure low concentration of CO accurately & reliably.

### Expected Output

A breach of a trigger level or emission limit values may indicate a significant increase of a contaminate concentration in an environmental medium.

Baseline Monitoring is monitoring in and around the location of a proposed site so as to establish background environmental conditions prior to any development of the proposed site. In case of existing facilities, baseline-monitoring serves as a reference point to which later monitoring results are compared. The information will be used to evaluate in future compliance monitoring.

Compliance monitoring is periodic monitoring and is to determine whether there is any release of contaminants to the environment and to demonstrate compliance within the project area. It includes measurements of process conditions, process emissions and levels in receiving environments and the reporting of the results of such measurements to demonstrate compliance with limits specified in the legislation.

The information provided by compliance monitoring is also valuable for other environmental and management activities (e.g. for optimizing process, protecting sensitive ecosystems and informing the public of the effectiveness of environmental protection measures).

Assessment monitoring is investigative monitoring which is initiated after detection of the impacts to the environment or on attaining a trigger level. The assessment monitoring will:

- Identify the source of release materials;
- Characterize the nature, extent and rate of releases;
- Evaluate the risk to the environment and to human health;
- Evaluate measures to prevent or minimize future releases;
- Provide information for the design and implementation of corrective measures and
- Express the residual environmental impacts for proper compensation.

**Reporting Requirements**

As it is proposed to carry out the monitoring program for two quarters and the proposed deliverables are scheduled below:

SL	Name	No. of copies
1	Monitoring Report after each monitoring mission (each in one quarter) with complete data, analysis, lab. Results, discussion etc. as intended in the scope of work.	12
2	CD-ROM in respect of documents/datasheets	2

## (F) Monitoring results

**Adroit Environment Consultants Ltd.**  
A House of Complete Environmental Management Solutions

**AECL LABORATORY ANALYSIS REPORT**  
**AMBIENT AIR QUALITY TEST REPORT**

**Project Title :** 2x660 MW Maitree Super Thermal Project  
**Project Location :** Rampal, Bagherhat

**Description of Sample :** Ambient Air  
**Sample Collector :** Adroit Environment Consultants Ltd. (Monitoring team)  
**Sampling date :** 25<sup>th</sup> January to 7<sup>th</sup> February, 2022  
**Reporting date :** 3<sup>rd</sup> March, 2022

**Description of analysis**

Sample Location ID	Concentration present of different parameter in ambient air							Remarks
	PM <sub>10</sub>	PM <sub>2.5</sub>	SPM	SO <sub>2</sub>	NO <sub>x</sub>	CO	O <sub>3</sub>	
AQ1	56.26	104.73	178.83	38.36	44.77	3.3	83	Not comply

(NF – not found, DoE – Department of Environment.)

**Note:** This monitoring report was usually accomplished by:- Respirable Dust Sampler (Model-Envirotech India APM-480BL) and Fine Particulate Sampler (Model- Envirotech India AAS-127 Min).

1. Fine Particulate Matter (PM<sub>10</sub>).
2. Respirable Dust Content (PM<sub>2.5</sub>).
3. Suspended Particulate Matter (SPM).
4. Oxides of Nitrogen (NO<sub>x</sub>).
5. Oxides of Sulfur (SO<sub>2</sub>).
6. Carbon Mono-Oxide (CO).

**Comment:** All the locations do conform to the standard allowable limits.
